SPECIFICATIONS

Power Consumption - 110 watts (At 117 volts 60 cycles)

Power Output - - - - - - - - 6 Watts Undistorted

Selectivity - - - - 170 KC Broad at 2 times Signal

Intermediate Frequency - - - - - - - 4.3 Megacycles

Speaker - - - - - - - - - - 8" P-M Dynamic

Tuning Frequency Range - - - - 42 to 50 Megacycles

Sensitivity - - - - - - - - 10 Microvolts Average

ALIGNMENT

If distortion, weak reception or other type of unsatisfactory performance is thought to be due to improper alignment, do not attempt to align the I-F or R-F system. Because of the wide band accepted by the I-F system and the lack of suitable generators and test equipment required to do a satisfactory job, it is recommended that the chassis be sent to one of the main Montgomery Ward Service Shops.

VOLTAGES AT SOCKETS

The voltages that should be considered normal at each tube socket terminal are indicated in the table at the bottom of the schematic circuit diagram. All voltages indicated are measured between the socket terminal and ground (chassis). Readings shown are positive on the socket terminal with the chassis as the negative terminal except where a negative voltage reading is given in which case the chassis is positive. Readings marked "AC" indicate normal AC heater voltage and should not be read with a DC meter.

These voltages are read under the following conditions:

Line Voltage—117 volts
Volume Control—Maximum
No Signal Being Received

Readings are taken with a 1000-ohm-per-volt meter. Plate and screen voltages are read on the 500-volt scale. All readings under 50 volts are read on the 50-volt scale.

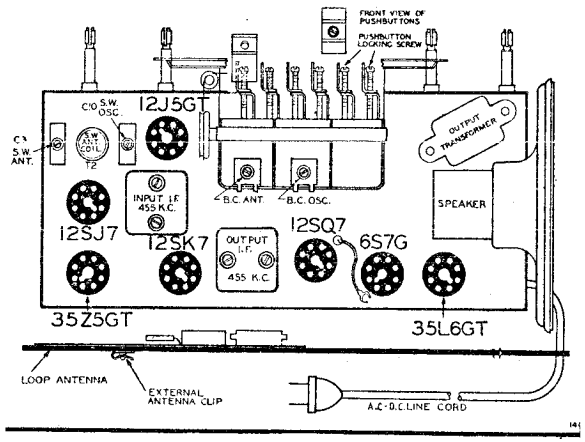
Voltage Chart



Chassis View, showing Tube Location and the Outside Antenna Clip.

SETTING THE PUSHBUTTONS

Make a list of your 6 favorite stations—push out the call letters of these stations from the call letter sheets supplied. Next insert a long slim screw driver into the hole in front of one of the pushbuttons and unscrew the pushbutton locking screw (to the left) several turns. Now with the screw driver still engaged in the locking screw slot push it all the way in. Hold it in this position and tune in the station you want with the tuning knob. Now tighten up the pushbutton locking screw by turning it to the right. Tighten firmly. Continue setting each button in the same way. When you have set your stations insert the call letter of each station in the front of the proper button and put one of the celluloid tabs over the station call letter.

To change stations simply repeat the above procedure.

If you are unable to set a station on any particular button it is probably because the pushbutton locking screw has not been fully unloosened (turned to the left).

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect B—of radio chassis to ground post of signal generator through .1 Mfd. condenser.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted to Maximum
I. F.	455 Kc.	.1 MFD.	Grid of 12SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Output I. F.
	455 Kc.	.1 MFD.	Grid of 12SJ7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Input I. F.
SHORT WAVE BAND	12 Mc.	400 Ohms	External Antenna and B—	Short Wave	Set Dial at 12 Mc.	S.W. Osc. trimmer C10 S.W. Ant. trimmer C3
BROAD-CAST BAND	1600 Kc.	.1 mmf.	Grid of 12SJ7	Broadcast	Rotor full open (Plates out of mesh)	B.C. Osc. trimmer C12 on Gang
	1400 Kc.	200 mmf.	External Antenna and B—	Broadcast	Set Dial at 1400 K. C.	B.C. Ant. trimmer C6

NOTE: The Oscillator Frequency is lower than the signal frequency and should be aligned accordingly.

The loop antenna should be connected to the radio when making all adjustments.

MODEL 14WG-538B

MONTGOMERY WARD

MONTGOMERY WARD

SPECIFICATIONS

Input Voltages and Currents—Battery Operation

"A" Battery - - - - 1½ Volts—.25 Amp.

"B" Battery - - - - 88½ Volts—8. Ma.

Power Consumption - - - - - - 30 Watts (At 117 Volts AC Supply)

Power Output

Battery Operation - 55 Mw. Undistorted, 110 Mw. Maximum

AC Operation - - 80 Mw. Undistorted, 170 Mw. Maximum

Selectivity - 40 KC Broad at 1000 Times Signal

Intermediate Frequency - - - - - 456 KC

Speaker - - - - - - - - 4" P.M. Dynamic

Tuning Frequency Range - 535 to 1610 KC

Sensitivity - 400 Microvolts per Meter Average (For .05 Watt Output)

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

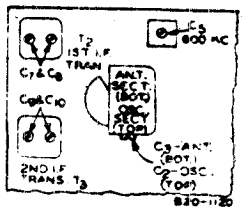
The following equipment is required for aligning:

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Use Loop for All Adjustments—See Note "A"

Signal Gen. FREQUENCY SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	Turn Rotor to Full Open	1st I.F. (C7) & (C8) 2nd I.F. (C9) & (C10)
1610 KC	Turn Rotor to Full Open	Oscillator (C2)
1500 KC	Turn Rotor to Max. Output Set Knob to 1500 KC	Antenna (C3)
600 KC	Turn Rotor to Max. Output	600 KC (C5) Rock Rotor—See Note B
1500 KC	Turn Rotor to Max. Output	Antenna (C3)



NOTE A—Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place radio approximately 2 feet (6" for I.F. adjustment) from loop.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

To replace the 35Z5GT rectifier tube, pull line cord plug out of case. Carefully pry off the 2 control knobs. Remove screw on the front panel above tuning knob at side of on-off switch plunger. Then take out the 3 chassis screws (shown in illustration) with a ¼ inch socket wrench. Carefully lift chassis, tilting it at the same time, as far as connecting wires permit. Insert a screwdriver between rectifier tube and socket and pry tube out of socket.

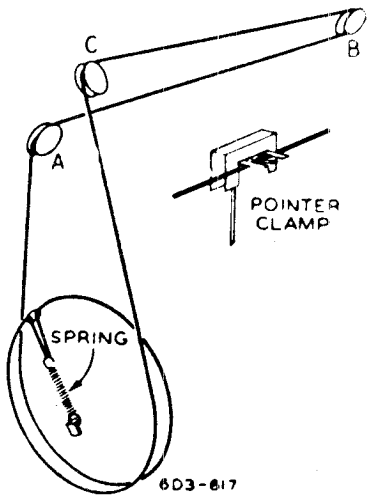
DRIVE CORD REPLACEMENT

Knot both ends of new drive cord to same loop on tension spring. The doubled drive cord should measure 16¼ inches. Turn gang condenser to full open position—See illustration.

Thread looped end of drive cord up through hole in rim of drive pulley. Pull spring flush against inside of rim. Wind right hand portion of drive cord (from drive pulley side of chassis) one turn clockwise around drive pulley. This turn should be on right side of pulley groove (from back of chassis).

Continue cord over pulleys A, B, and C as shown. Loop remaining portion of cord counter-clockwise (from spring) (drive pulley side of chassis) around drive pulley. Secure spring to hook on drive pulley—See illustration.

Calibration — Tune in a signal of known frequency. Set pointer at this frequency mark on the dial scale. Fasten pointer to drive cord —See illustration.



Power Consumption - 28 Watts (At 117 volts AC Supply)
Power Output - - - - - - - .8 Watt Undistorted
Selectivity - - 50 KC Broad at 1000 times Signal
Intermediate Frequency - - - - - - - - 456 KC

Speaker - - - - - - - - - 5" Electro Dynamic
Tuning Frequency Range - - - 528 to 1600 KC
Sensitivity (For .05 Watt Output)
External Antenna - - - - - 10 Microvolts Average

CAUTION

The metal chassis is connected to one side of the line through a .2 mfd. condenser. Both AC and DC power lines are generally grounded on one side. If the side of the line not connected to the metal chassis through this condenser is grounded and the metal chassis comes in contact with an external ground, this condenser will be connected across the line and there will be an increase in hum.

Therefore, in any service work on the chassis, keep it on a wood or other insulated surface to avoid contacts with ground. The person working on the set should avoid getting in contact with any ground.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 100 mmf.

SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR ANTENNA CONNECTION	SIGNAL GENERATOR GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	Control Grid 12SK7—I.F.	Point "X" (12SK7—R.F. Prong No. 3)	.1 mf.	Turn Rotor to full open	2nd I.F. (C9) & (C10)
456 KC	Control Grid 12SA7—1st Det.	Same As Above	.1 mf.	Turn Rotor to full open	1st I.F. (C7) & (C8)
1600 KC	Control Grid 12SA7—1st Det.	Same As Above	.1 mf.	Turn Rotor to full open	Oscillator (C3)
1500 KC	External Antenna Clip On Loop —See Note A	External Ground Clip On Loop	100 mmf.	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note B	Antenna (C2)

NOTE A—By means of wooden blocks, stand the loop aerial assembly upright exactly 1¼ inches from the back of the chassis.

NOTE B—If the pointer is not at 1500 KC on the dial, tune in a 1500 KC signal. Set pointer at the 1500 KC mark on the dial scale.

MODELS 14WG-610B, 14WG-611B

PROCEDURE FOR SETTING THE STATION BUTTONS

SELECTING THE STATIONS TO BE SET

There are 6 buttons on the automatic tuning dial by means of which 6 stations may be set for quick tuning.

Make a list of your favorite stations, those which you tune in regularly. There may be any number up to and including 6 in this list.

It is better to list the station with the lowest kilocycle number first, the station with the next higher kilocycle number next, and so on.

Any button may be used for any station you can receive, although it will be more convenient to set the stations so that the kilocycle numbers increase from left to right.

SETTING A STATION BUTTON

Pull the button at the left off the shaft. When this is done, the locking screw shaft will be exposed.

Insert a screwdriver in the slot of the locking screw and depress it by pressing in with the screwdriver. Loosen the locking screw by turning 3 or 4 turns in a counter-clockwise direction. Continue to press in firmly on the screwdriver, thus holding the locking screw shaft depressed. Select the first station from the list you have prepared and carefully tune in this station by means of the manual tuning control until the station is clearest and strongest.

Continue to press in firmly on the screwdriver and lock the mechanism by turning the locking screw in a clockwise direction. Tighten firmly but not excessively. The station is now set on this button.

Proceed in the same manner to set stations on any of the remaining buttons.

Remove the correct station call letter tab from the sheets supplied by bending the sheet back and forth at the score mark until the tab can be broken off. Press this tab all the way to the bottom of the space provided in the button. Cover the call letter tab with a celluloid tab, pressing this in until it snaps into place.

Replace the button on its shaft with the lip at the bottom and the button placed so that the call letters are straight up and down.

If at any time you wish to change the setting of a button from one station to another, repeat the above procedure. Changing the setting of one button will not affect the setting of any of the other buttons.

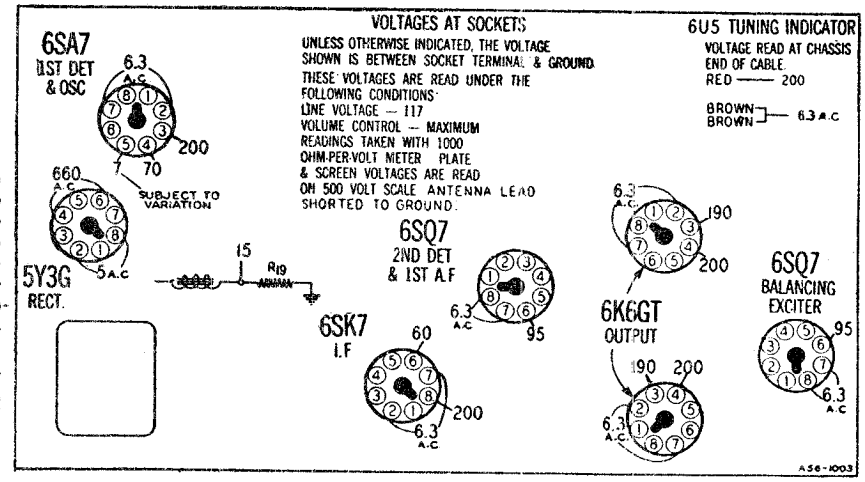
DRIVE CORD REPLACEMENT

Turn gang condenser to full closed position. Using a new drive cord 42 inches in length, tie one end to tension spring. Fasten other end of tension spring to hook on drive pulley. Pass drive cord through slot in drive pulley rim. Continue cord ½ turn counter-clockwise (from gang end of chassis) around drive pulley—See illustration. Wind 2½ turns, counter-clockwise (from rear of chassis), around wooden spool on tuning shaft. Turns should progress toward the rear of chassis.

Pass cord through wire string guide and around pulleys A, B, and C as shown. Continue cord ½ turn, counter-clockwise (from gang end of chassis) around drive pulley and pass through slot in pulley rim. Stretch tension spring and tie drive cord to tension spring.

Power Consumption - 57 Watts (at 117 volts 60 cycles)
77 Watts (Phonograph Operating)
Power Output - - - - 3.0 Watts Undistorted
4.5 Watts Maximum
Selectivity - 38 KC Broad at 1000 times Signal
Intermediate Frequency - - - - - - - 456 KC
Speaker - - - - - - - - 10" Electro-Dynamic

Band	Tuning Frequency Range	Sensitivity External Antenna (For 0.5 Watt Output)
B Range	535 to 1610 KC	15 Microvolts Aver.
19 Meter	14.6 to 15.8 MC	26 Microvolts Aver.
25 Meter	11.1 to 12.0 MC	25 Microvolts Aver.
31 Meter	9.3 to 10.05 MC	22 Microvolts Aver.



PROCEDURE FOR SETTING THE STATION BUTTONS

Make a list of your six favorite stations, those which you tune in regularly. It is better to list the station with the highest kilocycle number first, the station with the next lower kilocycle number next, and so on.

Grasp the left-hand button at the sides (depress the adjacent button) and pull it out as far as it will go. A click will be heard. If it is impossible to depress the button which is adjacent to the button you are setting, rotate the tuning knob a few turns.

Select the first station from the list you have prepared. *Carefully* tune in this station by means of the manual tuning knob until the dark sector in the tuning eye is narrowest.

Now lock the mechanism by pushing the button all the way in until it is felt to lock into place.

Proceed in the same manner to set stations on any of the remaining buttons. Any button may be used for any station you can receive, although it will be more convenient to set the stations so that the kilocycle numbers decrease from left to right.

Remove the correct station call letter tab from the sheets supplied by bending the sheet back and forth at the score mark until the tab can be broken off. Press the tab all the way to the bottom of the space provided in the button. Cover the call letter tab with a celluloid tab, pressing this in until it snaps into place.

Changing the setting of one button will not affect the setting of any of the other buttons.

REPLACING BAND SPREAD COILS

It is not practicable to make field replacements of the individual antenna and oscillator coils in the Band Spread Assembly Unit.

Should one of these coils be damaged in any way, remove the Band Spread Assembly Unit (consisting of the 3 antenna and 4 oscillator coils, the right-angle mounting plate, and the band switch) from the chassis and return to the factory for replacement.

CAUTION—Two of the coils in the band spread coil assembly, the 19 Meter Antenna and Oscillator coils, have adjustable iron cores. One of the adjusting screws extends out from the front panel of the chassis base at the left of the band switch. The other adjusting screw extends up from the chassis base in front of the 1st I.F. Transformer.

DO NOT CHANGE THE POSITION OF THESE ADJUSTING SCREWS as they have been properly set at the factory and cannot be satisfactorily re-adjusted in the field.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—Reassemble chassis in cabinet.

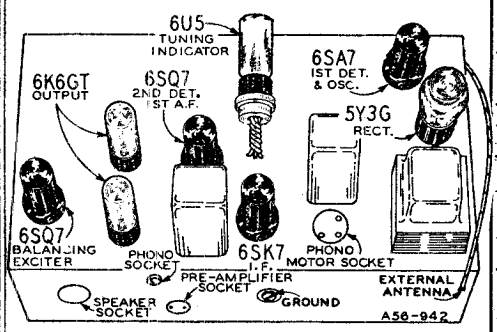
MODELS 14WG-808WA, 14WG-808MA.

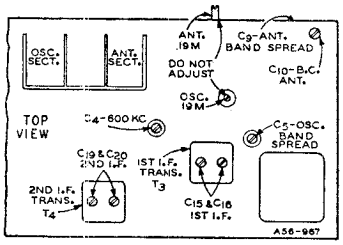
MONTGOMERY WARD

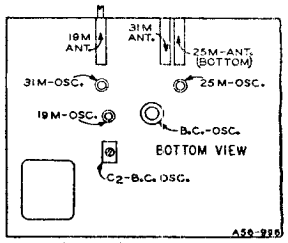
ANTENNA AND GROUND

Two built-in Air Wave Aerials are incorporated in the cabinet.

One of these, the loop aerial, is used for broadcast band reception. The other, a counterpoise foil aerial, is used for reception on the short wave band. For the reception of local or nearby stations, an outside antenna and ground are usually not required.







ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

RESISTOR AND COIL VALUES SHOWN IN OHMS.
CAPACITOR VALUES SHOWN IN MFD UNLESS OTHERWISE INDICATED.

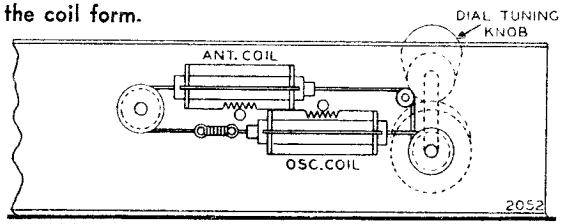
NOTES

FIGURES AND LETTERS OPPOSITE SOCKET PIN NUMBERS ARE VOLTAGE READINGS TAKEN WITH A 5,000-OHMS-PER-VOLT METER BETWEEN SOCKET TERMINALS AND B- . LINE VOLTAGE 117 V. AC.

A - CANNOT BE MEASURED WITH VOLTMETER.
B - 12 VOLTS AC BETWEEN PINS 2 AND 7
C - 12 VOLTS AC BETWEEN PINS 7 AND 8
D - 45 VOLTS AC BETWEEN PINS 2 AND 7
E - 32 VOLTS AC BETWEEN PINS 2 AND 7

ANTENNA COIL ADJUSTMENT

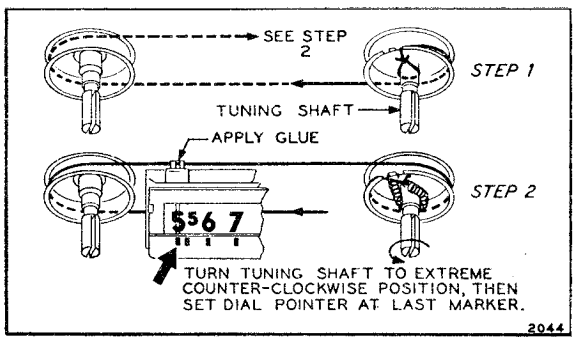
The antenna coil assembly (see illustration) is made so that it is movable left or right. When making the adjustment as required in the alignment procedure, move the coil assembly very slowly, either by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.



View of Tuning Coil Assembly.

NOTES ON DRIVE CORD REPLACEMENT

1. Eighteen inches (18") of cord are required.
2. When tying the string to the tension spring (step 2), make sure that the spring takes up all slack.



ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, DC or 50-60 cycle AC, 28 watts. Also made for 25-cycle AC.
Frequency Range	540 to 1720 kc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc, 69 kc at 1000 x signal.
Sensitivity	28 microvolts average for .05 watt output.
Power Output	0.96 watts undistorted, 1.58 watts maximum.
Loud Speaker	4", P.M., v.c. impedance 3.2 ohms.

MODELS 54BR-1501A,
54BR-1502A

MONTGOMERY WARD

Output meter across 3.2-ohm output load.
Volume control at maximum for all adjustments.

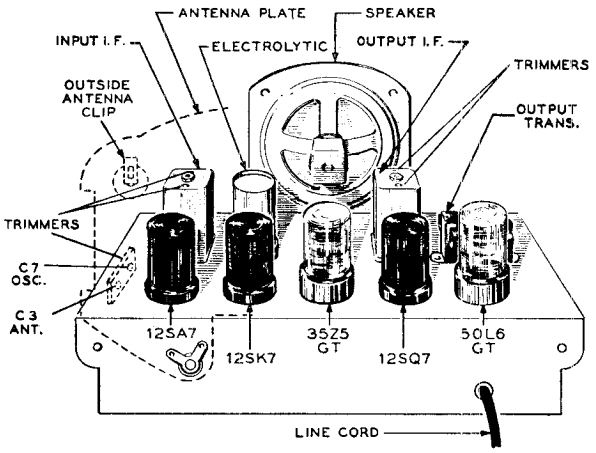
• Align for maximum output.
• Reduce input as needed to keep output near 0.4 volts

SIGNAL GENERATOR				TUNER SETTING	ADJUST TRIMMERS TO MAXIMUM OUTPUT in order shown
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	.1 mf	Metal antenna plate	12SQ7 Pin 3	Iron cores all the way out	Trimmers on output and input I.F. cans
1720 kc	.1 mf	Metal antenna plate	12SQ7 Pin 3	Iron cores all the way out	Oscillator trimmer C6
1720 kc	200 mmf	External antenna clip	12SQ7 Pin 3	Iron cores all the way out	Antenna trimmer C3
1400 kc	200 mmf	External antenna clip	12SQ7 Pin 3	Turn dial to 1400 kc	Adjust position of ant. coil (see coil assembly view)
1720 kc	200 mmf	External antenna clip	12SQ7 Pin 3	Turn dial to 1720 kc	Antenna trimmer C3*

*After the antenna coil has been tracked at 1400 kc, it is necessary to check the antenna trimmer C3 again at 1720 kc. If no appreciable change in trimmer adjustment is necessary, the coil is in track. If the trimmer requires considerable change, the position of the antenna coil at 1400 kc must be readjusted. These two adjustments should be made several times, until no trimmer adjustment is required at 1720 kc.

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 kc for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000-kc and 455-kc signals modulated 30% with a 400-cycle audio signal. Variations of plus or minus 25% are usually permissible.



SIGNAL GENERATOR				INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	
1000 kc	200 mmf or RMA dummy antenna	External antenna clip	12SQ7 Pin 3	28 microvolts
1000 kc	.1 mf	Converter 12SA7, pin 8	12SQ7 Pin 3	89 microvolts

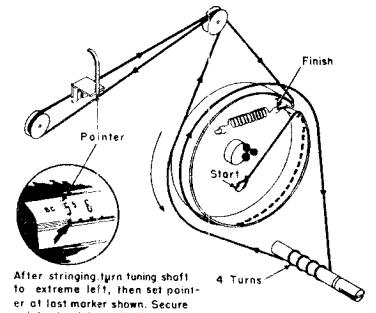
*The values of the resistors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows:

Pre-standardized value—50,000 ohms, ±10%, ⅓ watt
RMA value—47,000 ohms, ±10%, ½ watt

NOTE ON TUBE REPLACEMENT

Replace a defective metal 12SK7 tube with another metal tube. Replace a glass 12SK7 tube with a metal tube or with an exact duplicate of the tube now in the set.

MODELS 54BR-1503B, 1504B



After stringing, turn tuning shaft to extreme left, then set pointer at last marker shown. Secure pointer to string with glue.

203-A

CAPACITOR VALUES IN MFD UNLESS OTHERWISE INDICATED.
RESISTOR AND COIL VALUES IN OHMS.
WHERE VALUE OF COIL IS NOT SHOWN, RESISTANCE IS LESS THAN ONE OHM.
NOTES:
VOLTAGES MEASURED WITH A 5000-OHMS-PER-VOLT METER BETWEEN B- AND SOCKET TERMINALS. LINE VOLTAGE 117 VOLTS AC
(A) CANNOT BE MEASURED WITH VOLTMETER.
(B) 11 VOLTS AC ACROSS PINS 2 AND 7.
(C) 11 VOLTS AC ACROSS PINS 7 AND 8
(D) 35 VOLTS AC ACROSS PINS 2 AND 7
(E) 49 VOLTS AC ACROSS PINS 2 AND 7
(F) 117 VOLTS AC ACROSS PINS 2 AND 4
WHERE NO READING IS INDICATED VOLTAGE IS ZERO.

Power Supply.....105 to 125 volts, DC or 50-60 cycle AC, 24 watts. Also made for 25-cycle AC.

Power Output.....0.9 watt undistorted, 1.0 watt maximum.

Frequency Range.....530 to 1630 kc.

Loud Speaker.....4" x 6" oval, P.M., v.c. impedance 3.2 ohms.

Intermediate Freq....455 kc.

Selectivity.....At 1000 kc, 60 kc at 1000 x signal.

Sensitivity.....26 microvolts average for .05-watt output.

MODELS 54BR-1503A, -1504A and 54BR-1503B, 1504B are the same with the exception of the dial drive and certain mechanical parts.

MODELS 54BR-1503C, 54BR-1504C

ALIGNMENT PROCEDURE

Output meter across 3.2-ohm output load.
Volume control at maximum for all adjustments.
Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
Loop antenna should be connected to receiver and in its proper position when making adjustments.

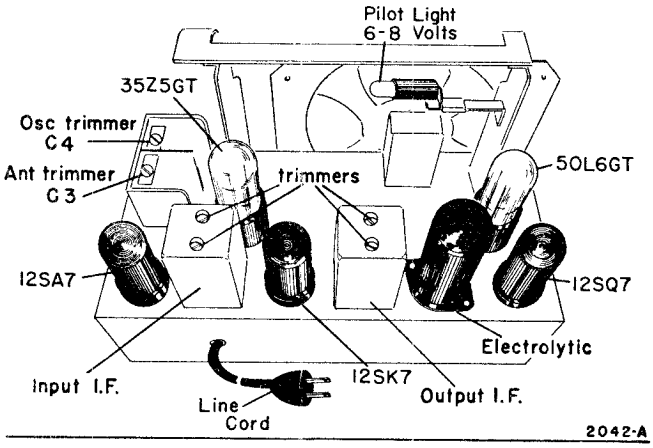
SIGNAL GENERATOR				TUNER SETTING	ADJUST TRIMMERS TO MAXIMUM OUTPUT in order shown
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	0.1 mf	Grid (pin 4) of 12SK7	Pin 3 of 12SK7 (B- of set)	Capacitor full open (plates out of mesh)	2 trimmers on output IF can
455 kc	0.1 mf	Grid (pin 8) of 12SA7	Pin 3 of 12SK7 (B- of set)	Capacitor full open (plates out of mesh)	2 trimmers on input IF can
1630 kc	0.1 mf	Grid (pin 8) of 12SA7	Pin 3 of 12SK7 (B- of set)	Capacitor full open (plates out of mesh)	Oscillator trimmer C4 on gang
1400 kc	200 mmf	External antenna clip	Pin 3 of 12SK7 (B- of set)	Set dial pointer at 1400 kc	Antenna trimmer C3 on gang

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 kc for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of 0.4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 kc and 455 kc signals modulated 30% with a 400-cycle audio signal. Variations of plus or minus 25% are usually permissible.

The volume control must be set to maximum.



Chassis View, Showing Trimmer Location

SIGNAL GENERATOR				INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	
1000 kc	200 mmf or RMA dummy antenna	External antenna clip	Pin 3 of 12SK7 (B- of set)	24 microvolts
1000 kc	0.1 mf	Grid (pin 8) of converter (12SA7)	Pin 3 of 12SK7 (B- of set)	98 microvolts
455 kc	0.1 mf	Grid (pin 8) of converter (12SA7)	Pin 3 of 12SK7 (B- of set)	74 microvolts
455 kc	0.1 mf	Grid (pin 4) of I.F. amp. (12SK7)	Pin 3 of 12SK7 (B- of set)	3200 microvolts
400 cycles	0.1 mf	Grid (pin 2) of audio amp. (12SQ7)	Pin 3 of 12SK7 (B- of set)	.043 volts
400 cycles	0.1 mf	Grid (pin 5) of output amp. (50L6GT)	Pin 3 of 12SK7 (B- of set)	2.0 volts

*SPECIAL NOTE ON RESISTORS: The values of all resistors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows:

Pre-standardized value—50,000 ohms, ±10%, 1/3 watt
RMA value—47,000 ohms, ±10%, 1/2 watt

NOTE ON TUBE REPLACEMENT

Replace a defective metal 12SK7 tube wtih another metal tube. Replace a glass 12SK7 tube with either a metal tube or with an exact duplicate of the tube now in the set.

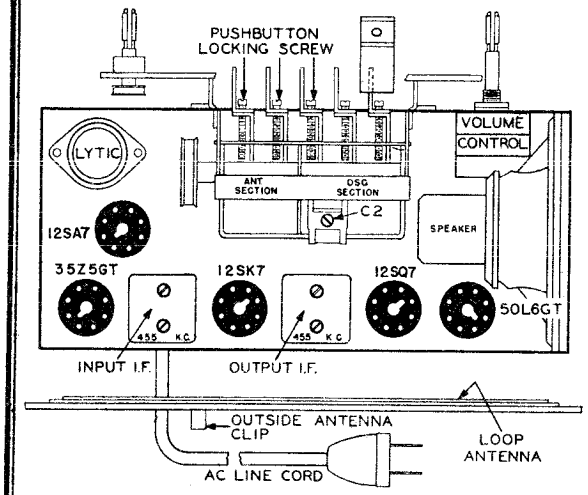
ALIGNMENT PROCEDURE

Volume control setting—Maximum (extreme clockwise) for all adjustments.
Connect ground lead of signal generator to B— of radio chassis through a 0.1 mfd. condenser.
The loop antenna should be connected to the radio and in its proper position when making all adjustments.

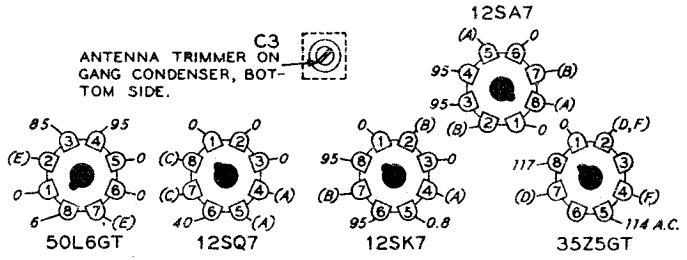
BAND	Signal Generator Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmer Adjusted to Maximum
I. F.	455 Kc.	.1 mfd.	Grid of 12SK7 I. F.	Rotor full open (Plates out of mesh)	Two trimmers on top of Output I. F.
	455 Kc.	.1 mfd.	Grid of 12SA7 Mixer	Rotor full open (Plates out of mesh)	Two trimmers on top of Input I. F.
BROADCAST	1600 Kc.	200 mmf.	Grid of 12SA7	Rotor full open (Plates out of mesh)	B.C. Osc. trimmer C2 on Gang
	1400 Kc.	200 mmf.	External Antenna and B—	Set Dial at 1400 K. C.	B.C. Ant. trimmer C3 under Gang



A-CANNOT BE MEASURED BY VOLTMETER
B-11 VOLTS A.C. ACROSS PINS 2 AND 7
C-11 VOLTS A.C. ACROSS PINS 7 AND 8
D-33 VOLTS A.C. ACROSS PINS 2 AND 7
E-48 VOLTS A.C. ACROSS PINS 2 AND 7
F-117 VOLTS A.C. ACROSS PINS 2 AND 4

ALL VOLTAGES MEASURED WITH A 1000-OHMS/VOLT VOLTMETER BETWEEN TERMINAL INDICATED AND B-. LINE VOLTAGE 117 VOLTS A.C.

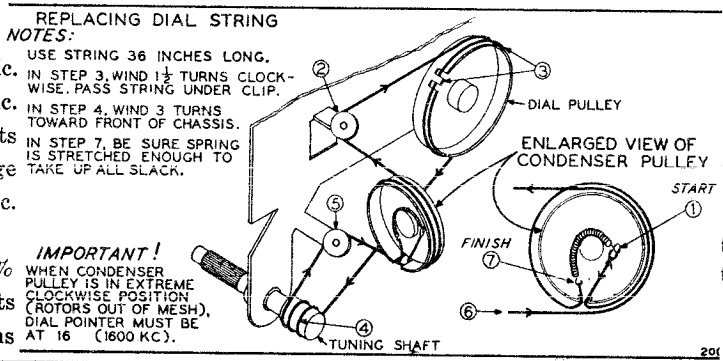
Voltages at tube socket terminals



Technical Data

Tuning range	535 to 1600 Kc.
Intermediate Frequency	455 Kc.
Power consumption	35 watts
Sensitivity (for 0.05 watt output)	30 microvolts average
Selectivity. 58 Kc. broad at 1000 times signal at 1000 Kc.	
Power output (in voice coil)	
Undistorted	1.0 watt at 10%
Maximum	1.7 watts
Voice coil impedance	3.2 ohms

BOTTOM VIEW OF CHASSIS



REPLACING DIAL STRING
NOTES:
USE STRING 36 INCHES LONG.
IN STEP 3, WIND 1½ TURNS CLOCKWISE. PASS STRING UNDER CLIP.
IN STEP 4, WIND 3 TURNS TOWARD FRONT OF CHASSIS.
IN STEP 7, BE SURE SPRING IS STRETCHED ENOUGH TO TAKE UP ALL SLACK.
IMPORTANT! WHEN CONDENSER PULLEY IS IN EXTREME CLOCKWISE POSITION (ROTORS OUT OF MESH), DIAL POINTER MUST BE AT 16 (1600 KC).

FINISH
TUNING SHAFT

SETTING THE PUSHBUTTONS

The pushbuttons may be used, after adjustment, for the automatic tuning of any five stations which you select. They can be set up in any order.

1. Turn on the radio. Allow it to warm up for at least one minute.

2. Push out the call letters of the five stations from the sheets supplied with this manual.

3. Insert the long thin screwdriver (supplied with the set) into the hole in one of the pushbuttons and turn the pushbutton locking screw several turns to the left.

4. With the screwdriver still engaged in the locking screw slot, **push** the screw all the way in. Hold it in this position and with the tuning knob tune in the station you want.

5. Now turn the pushbutton locking screw to the right and **tighten it firmly.** Remove the screwdriver.

6. Press the pushbutton all the way in (this tunes in the station) and, by rotating the tuning dial back and forth, determine whether the button has been properly set. If it has not, repeat the procedure described above.

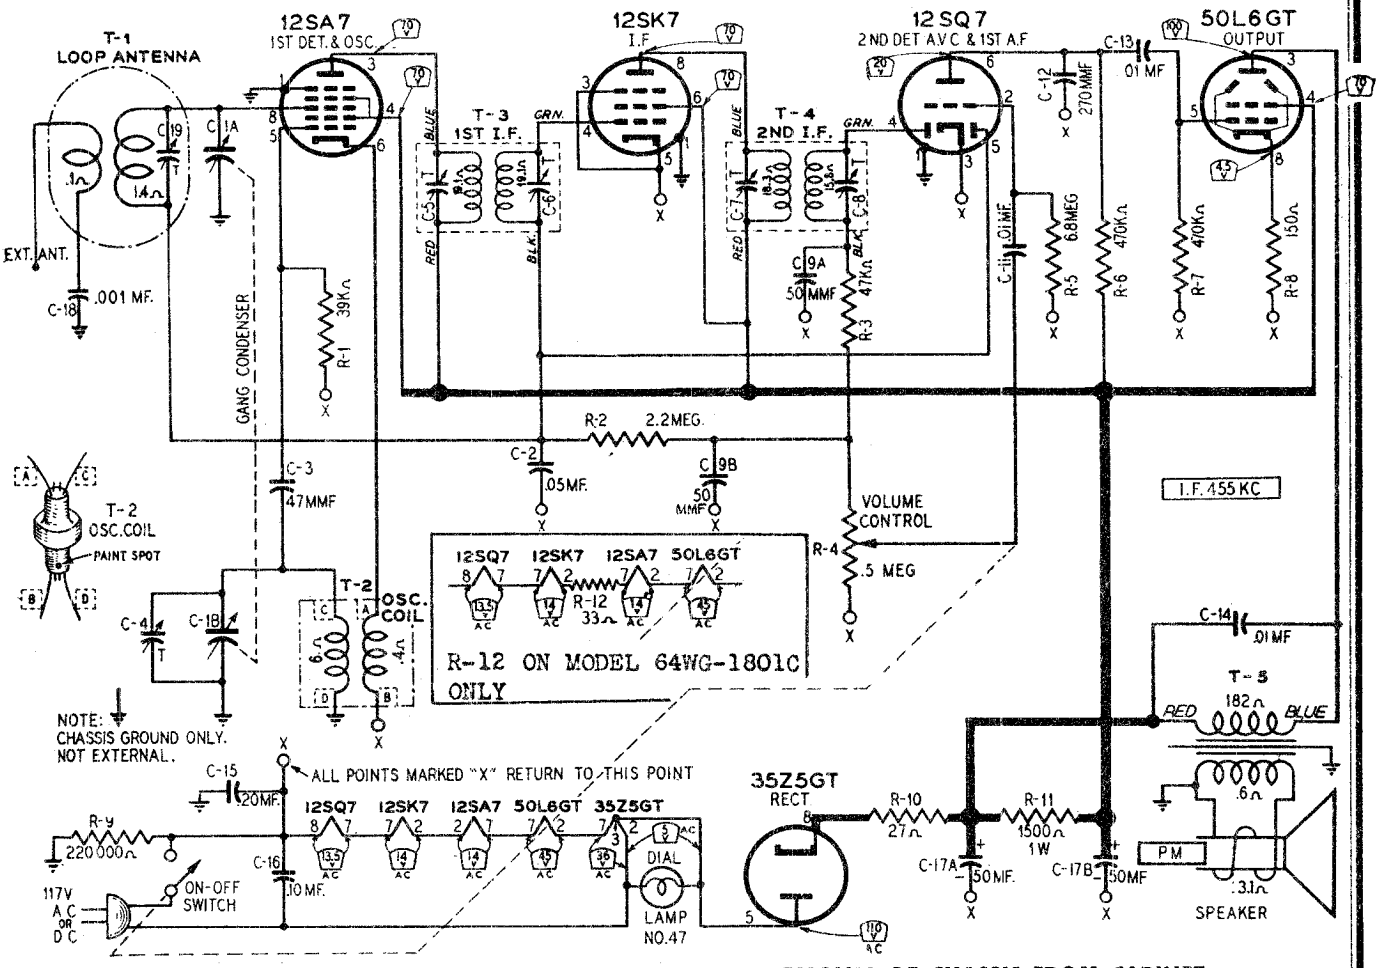
7. Insert the call letters for the station in the button and put one of the celluloid tabs over the letters.

8. Set each of the four other buttons, one for each station, in the same way. If you are unable to set a station on any particular button, it is probably because the pushbutton locking screw has not been loosened.

9. Any of the five stations may now be tuned in simply by pushing the proper button in as far as it will go.

MONTGOMERY WARD

MODELS 54WG-1801A, 54WG-1801B
MODEL 64WG-1801C



Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

REMOVAL OF CHASSIS FROM CABINET

To remove the chassis from the cabinet it is necessary to pull the two control knobs and the dial pointer from their shafts. Remove the four screws in the bottom of the cabinet and the four snap pins that hold the cabinet back in place.

Care must be taken when removing the dial pointer that it is not damaged in such a manner that reinstallation will not be possible.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of plus or minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Freq.	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—external antenna clip	Chassis	24 microvolts
1000 kc	.05 mf	12SA7 1st Detector pin 8	Point "X" (12SK7 pin 3)	125 microvolts
455 kc	.05 mf	12SA7 1st Detector pin 8	Same as above	100 microvolts
455 kc	.05 mf	12SK7, I-F Amp. pin 4	Same as above	2500 microvolts
400 cycles	.05 mf	12SQ7, 1st AF, pin 2	Same as above	.042 volts
400 cycles	.05 mf	50L6GT Output, pin 5	Same as above	1.9 volts

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning: Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mf.

SIGNAL GENERATOR				CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM See Trimmer Illustration
Frequency Setting	Coupling Capacitor	Connection To Radio	Ground Connection		
455 kc	.1 mf	Control Grid 12SK7—I-F	Point "X" 12SK7—I-F Prong No. 3	Turn Rotor to full open	2nd I-F (C7) & (C8)
455 kc	.1 mf	Control Grid 12SA7—1st Det.	Same as above	Turn Rotor to full open	1st I-F (C5) & (C6)
1600 kc	.1 mf	Control Grid 12SA7—1st Det.	Same as above	Turn Rotor to full open	Oscillator (C4)
1400 kc	50 mmf	External Antenna Clip on Loop See Note A	Chassis	Turn Rotor to Max. Output Set Indicator to 1400 KC— See Note B	Antenna (C19)

NOTE A—Re-assemble chassis in cabinet. Replace back on cabinet.

NOTE B—Tune in a 1400 KC signal. If pointer is not at the 1400 KC mark on the dial scale, pull pointer off shaft. Set pointer at the 1400 KC mark and push back on shaft.

Power Supply..... 105-125 volts AC—50-60 cycles—30 watts 105-125 volts DC
Frequency Range..... 535 to 1620 KC
Intermediate Frequency..... 455 KC
Selectivity..... 55.5 KC broad at 1000 times signal, 1000 KC
Sensitivity (for .05 watt output) with external antenna..... 25 microvolts average
Power Output..... 1.5 watts maximum, .9 watt (10% distortion)
Loud speaker..... 5" PM dynamic
Voice coil impedance..... 3.2 ohms at 400 cycles

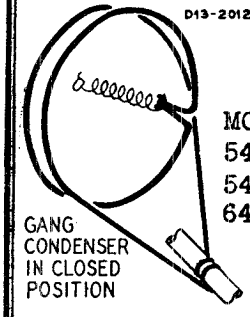
DRIVE CORD DIAGRAM



DRIVE CORD REPLACEMENT

MODELS 54 WG-1801A,54 WG-2007A

Turn the gang condenser to the fully closed position. Use a new drive cord 12 inches in length and tie one end to the tension spring. Fasten the other end of the tension spring to the hook on the drive pulley. Pass the cord through the slot in the drive pulley rim and continue around pulley one half turn, counterclockwise. Wind 2½ turns counterclockwise (from front of chassis) around tuning shaft. Turns should progress toward rear of chassis. (Wind 3 1/2 turns in tuning shaft for 54 WG-1801-B.) Wind cord counterclockwise around drive pulley in back of previous ½ turn. Pass cord through the slot in the pulley rim. Stretch tension spring and tie free end of cord to the spring. Cut off any excess string.

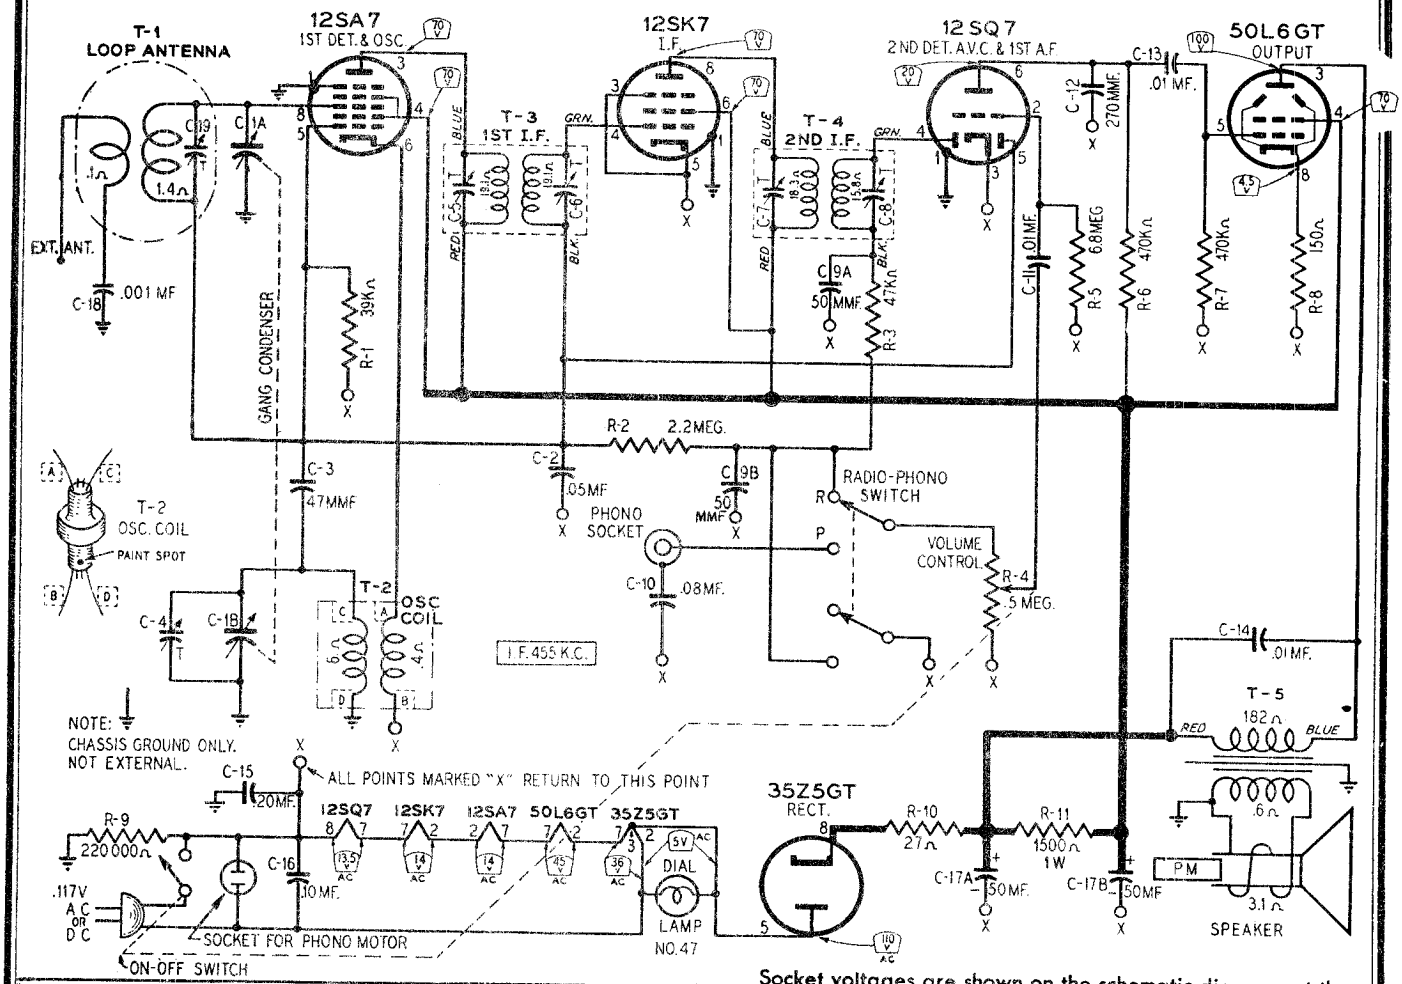
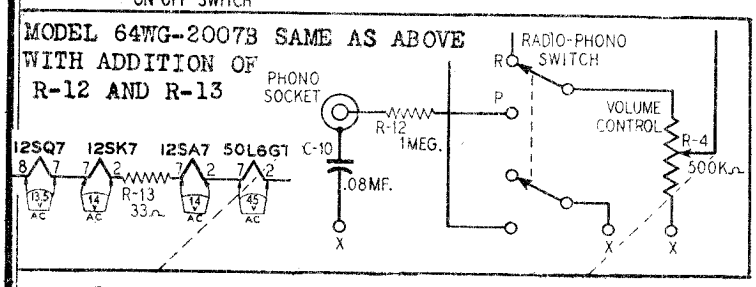
* IN MODEL 64WG-2007B ONLY

MODELS 54WG-2007A, 64WG-2007B

MONTGOMERY WARD





Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

The table below lists the sensitivity at the input of each stage. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—external antenna clip	Chassis	24 microvolts
1000 kc	.05 mf	12SA7 1st Detector Pin 8	Point "X" (12SK7 Pin 3)	125 microvolts
455 kc	.05 mf	12SA7 1st Detector Pin 8	Same as above	100 microvolts
455 kc	.05 mf	12SK7, I-F Amp. Pin 4	Same as above	2500 microvolts
400 cycles	.05 mf	12SQ7, 1st A-F, Pin 2	Same as above	.042 volts
400 cycles	.05 mf	50L6GT Output, Pin 5	Same as above	1.9 volts

MODELS 54WG-2500A, 54WG-2700A, RECEIVER STAGE SENSITIVITIES 64WG-2500B, 64WG-2700A

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output with the speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	External antenna lead (white)	Chassis	2.3 microvolts
1000 kc	.05 mf	6SJ7 1st Detector, Pin 4	Same as above	17 microvolts

50 CYCLE OPERATION

If it is desired to use the radio and record player on a 50 cycle power supply, it will be necessary to replace the metal drive pulley on the record player motor shaft with a 50 cycle pulley. This pulley is listed in the parts list.

To change the pulley, turn the record selector post to the 12" position and lift the turntable off of the record changer. Loosen the set screw holding the drive pulley on the motor shaft and remove the old pulley. Install the new 50 cycle pulley and replace the turntable.

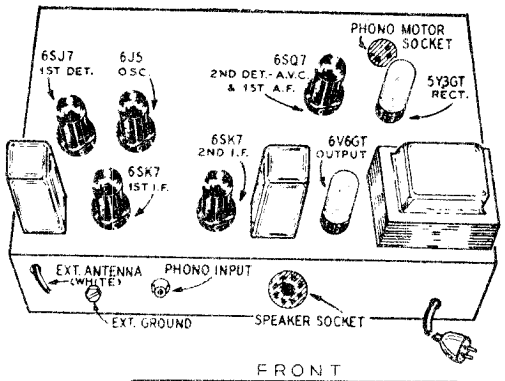
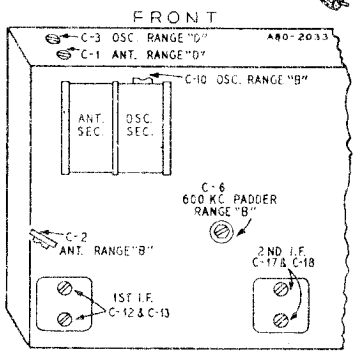
MONTGOMERY WARD

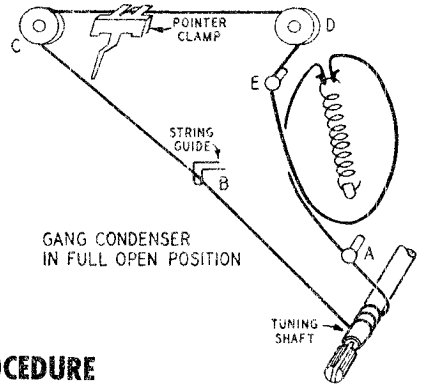




TRIMMER POSITIONS

DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully open position. Use a new drive cord 40" long and tie one end to the tension spring. Hook the other end of the tension spring to the tab on the drive pulley rim and continue one half turn counterclockwise around the drive pulley. Then pass the cord around idler stud A and wind three turns clockwise around the tuning shaft (turns must progress away from chassis). Pass cord through string guide B, over pulleys C and D and around idler stud E. Wrap ¾ turn counterclockwise around drive pulley, stretch the tension spring and tie free end of the cord to spring. Cut off any excess string.



DRIVE CORD DIAGRAM

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR		Dummy Antenna	Band Switch Setting	Condenser Setting	ADJUST TRIMMERS TO MAXIMUM
	Frequency Setting	Connection at Radio				
I-F	455 kc	6SJ7, Pin 4	.1 mf	B Range	Turn Rotor to Full Open	2nd I-F (C17) & (C18) 1st I-F (C12) & (C13)
RANGE B	1600 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Full Open	Oscillator Range B (C10)
	1400 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC See Note A	Antenna Range B (C2)
	600 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Max. Output	600 kc (C6) Rock Rotor—See Note B
Repeat above oscillator adjustments at 1600 and 600 KC until readjusting the oscillator Range B Trimmer (C10) causes no further improvement in output.						
RANGE D	18,300 kc	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C3)
	17,000 kc	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Antenna Range D (C1) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Max. Output	Antenna Range B (C2)

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, re-set pointer at the 1400 KC mark on the dial scale.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

Complete Unit Wiring Diagram

Voltages at Sockets

In the following chart are given the voltages at the sockets. Before checking the voltages at the sockets, a convenient point, in some cases, to check the applied "A" and "B" voltages is at the speaker terminal strip. A high resistance voltmeter should be used.

CAUTION—Do not check the "A" and "B" voltages at the multi-point socket on the cable head, as the pilot light may be burned out when the switch is turned off. This is due to the high inductance of the speaker field, which will increase the voltage at the break of the circuit. Also, when the cable head and multi-point socket is taken off, the connections between the chassis and power unit are open so that readings are not made under load conditions.

To read the voltages at the sockets, the chassis box, in most cases, will have to be taken off of its mounting. In some instances, the cables, which may be attached to the dash or at other points, will have to be taken off. The voltages can be read at the sockets with a long plug or with a pair of long, insulated test prods. If these are not available, it will be necessary to remove the chassis from the box. The multi-point socket on the cable head is then re-connected to the multi-point plug on the chassis. Considerable care must be taken when the chassis is out of the case in this manner to prevent accidental short circuits of plus "B" or plus "A" points to ground.

All tubes must be inserted and all units connected. A signal will effect the control voltages on the R. F., I. F., and first audio tubes. If signals are received, ground the antenna and remove the second detector tube to make the other readings.

Type of Tube	*Function*	*Across Heater*	*Plate to Cathode*	*Screen to Cathode*	*Grid to Cathode*	*Normal Plate MA*
'39	R. F.	6.	177	80	3	3.6
'36	1st Det.	6.	173	76	7(1)	.9(1)
'39	I. F.	6.	177	80	3	3.6
'37	2nd Det.	6.	0		0	0
'39	1st Audio	6.	54	77	6	1.2
'38	Output	6.	159	165	15.5	10

(1) Will vary with dial setting.

NOTE: All bias voltages must be read from cathode to ground.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated. A signal generator that will provide accurately calibrated signals over the broadcast band and an output indicating meter are desirable. The procedure is as follows:

As the I.F. stages are self-tuned, no I.F. aligning at the intermediate frequency of 262 K.C. is required.

First set the signal generator for a signal of exactly 1400 K.C. Connect the antenna lead from the signal generator to the antenna lead of the receiver and the ground lead of the signal generator to the ground of the receiver. Then turn the tuning condenser rotor until the marker is at 1400 K.C. on the dial scale. In order to do this, it will be necessary to put the chassis back in the cabinet. Adjust the two trimmers on the tuning condenser for maximum output adjusting the oscillator trimmer first (section nearest back of receiver).

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. This adjusting screw is between the 1st detector '57 and I.F. '35 sockets and is reached from the top of the chassis. A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condenser rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

The last step is to adjust the antenna short-wave adjusting condenser. Turn the Broadcast Short-Wave switch to the short-wave position. Set the signal generator for a signal of 1700 K.C. If the generator does not cover that frequency the 2nd harmonic of an 850 K.C. signal is satisfactory. Set the signal generator for a signal of 850 K.C. and the 2nd harmonic of this signal will be 1700 K.C., the required frequency. Turn the tuning condenser rotor until maximum output is obtained. Then adjust the antenna short-wave trimmer condenser to maximum output. The adjusting nut for this condenser is reached from the front of the chassis at the right hand side. A No. 4 Spintite wrench is necessary.

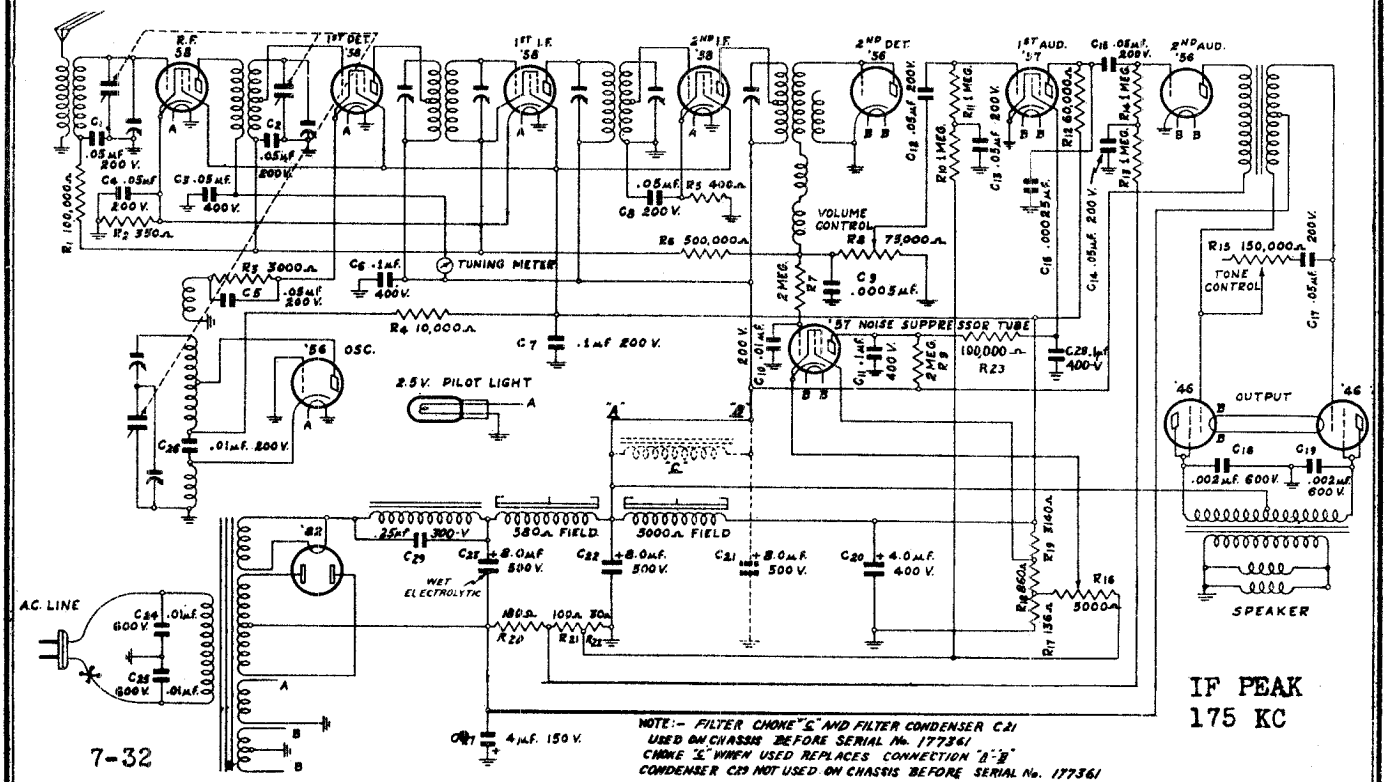
MODELS 62-51, 62-64, 62-64X



Differences in Early Models

If the first models of this receiver a slightly different filter system was used in the power unit. Condenser C-29, which tunes the separate choke, was not used. Condenser C-21, shown with dashed lines and the choke shown with dashed lines above the 5,000 ohm speaker field in Fig. 1 were used.

In the first models of this receiver individual tubular condensers were used instead of Condenser Block No. 80922. The condensers which make up this block are shown in the parts list. If replacements of any of the condensers are required, it is recommended that the individual tubular condensers be used.

In the early models, a vitreous enamel, six-section voltage divider resistor was used instead of the wire wound type used at the present time.

Setting the Noise Suppressor

The action of the noise suppressor is to establish a certain signal strength level below which all signals are cut out, and above which all signals come through without being reduced in intensity.

The general method of using the noise suppressor is to first turn the knob to the "Power" or right hand position. At this point there is usually considerable noise received. Turn the knob to the left until the noise is eliminated, and then continue to tune the set in the regular manner to whatever stations are wanted.

When tuning for far, distant stations, the knob should be turned to the extreme right hand or "Power" position, as the weak station signals may be cut out along with the noise signals if the noise suppressor is used.

When tuning in local stations the knob may be turned well toward the left hand or "Quiet" position, as the station signals are very powerful compared with the noise signals.

If the signal of a station is distorted, turn the noise suppressor knob to the right until the signal becomes clear.

MODELS 62-51, 62-64, 62-64X

MONTGOMERY WARD

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the five intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the signal generator is, in this instance, connected to the antenna lead of the receiver. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached from the top of the chassis and is between the tuning condenser and the coil cans. A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condenser rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

Replacing Rubber Drive

You will note that the Vernier tuning drive on this chassis uses a rubber pinion. Under normal operating conditions this rubber will last for a number of years. Should it become worn it can be readily replaced by loosening the set screw of the brass bushing located next to the rubber pinion and pulling out the station selector shaft. Place a new bushing in position, slip the station selector shaft in place and tighten the set screw.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

Set the signal generator for 175 K.C. Disconnect the grid cap from the first detector tube. Connect the antenna lead from the signal generator to the grid terminal of this tube. The ground lead goes to the ground connection. Then adjust the four intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next, set the signal generator for a signal of 1400 K.C. The input in this instance is made to the antenna lead of the receiver. Replace the grid cap on the first detector tube. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Then, set the signal generator for a signal of 600 K.C. The oscillator 600 K. C. trimmer condenser is underneath the chassis but the adjusting screw is reached from the top of the chassis and is adjacent to the oscillator coil can. Adjust this oscillator 600 K.C. trimmer condenser for maximum output, turning the rotor slowly back and forth over the 600 K.C. setting until highest output is obtained. A recheck may then be made of the alignment at 1400 K.C.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the four intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the signal generator is, in this instance, connected to the antenna lead of the receiver. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached from the top of the chassis and is between the I.F. and oscillator coil cans.

A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condensor rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

Voltages

Check the voltages at the sockets to see if correct voltages are being delivered to the tubes. The antenna and ground should be disconnected and the antenna and ground leads from the set connected together.

All of the D.C. voltage readings as shown on the chart are read with a 1,000 ohm per volt meter. As high a range as possible should be used. In general, the higher the resistance of the meter, the more accurate the reading will be.

Owing to the high resistance in the grid circuits of the R.F., 1st I.F., 1st audio and output tubes, the bias voltage cannot be read between the control grid and cathode of these tubes but must be read across the points as indicated in the references under the chart.

If a cable and plug are used to read the voltages, when making the readings at the I.F. socket, ground the control grid through a condenser to prevent oscillation.

The voltage chart gives the voltages with all tubes in, the speaker connected and the set in operating condition. These voltages are typical of the sets but will vary slightly with variations in individual receivers and variations in tube characteristics. All voltages in the chart are taken with a line voltage of 115. Differences in line voltage as well as differences in test equipment used will introduce other variations in the voltage readings.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

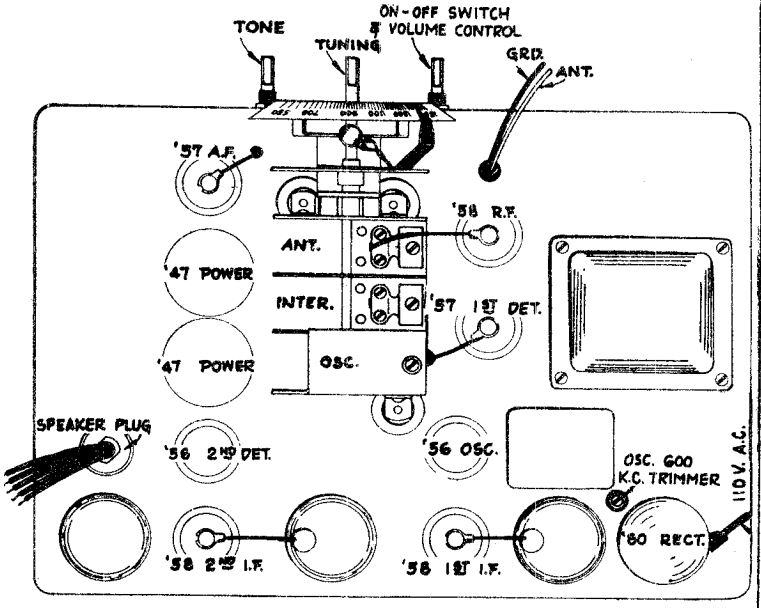
Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the four intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the signal generator is, in this instance, connected to the antenna lead of the receiver. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached from the top of the chassis and is between the I.F. and oscillator coil cans.

A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condensor rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.



Replacing Rubber Drive

You will note that the Vernier tuning drive on this chassis uses a rubber pinion. Under normal operating conditions this rubber will last for a number of years. Should it become worn it can be readily replaced by loosening the set screw of the brass bushing located next to the rubber pinion and pulling out the station selector shaft. Place a new bushing in position, slip the station selector shaft in place and tighten the set screw.

Dual Speaker Connections

Two speakers are used in this model. The fields of these speakers are connected in series and the voice coils in parallel. The resistance of each speaker field is 275 ohms

Circuit Description And Aligning Procedure

The tubes employed are as follows, and are operated at rated voltages and biases:

R.F.	58	Osc.	56
1st Det.	57	2nd Det.	55
I.F.	58	Audio	47

Rectifier..... 80

The second detector is the new dual diode triode, the diode portion operating as a detector and providing automatic volume control—acting on the grids of the R.F. and I.F. stages. The triode portion of this tube is operated as an individually biased A.F. amplifier.

In aligning, it is first desirable to see that the I.F. transformers are properly set. Both are on top of the base, the first having two adjustments, the second but one adjustment. The intermediate frequency is 175 K.C. Couple test oscillator into grid of first detector. Use an output meter.

The tuning condenser may be adjusted for alignment or "tracking" of the tuned circuits by means of an oscillator and output meter, also. The oscillator should cover the band from 550 to 1500 K.C. The energy from the oscillator should be coupled weakly into the antenna circuit. The receiver and oscillator are first tuned to approximately 1500 K.C., and, by watching the output meter the three condenser trimmers are adjusted for maximum output. These three trimmers must then be left untouched for all further aligning.

The next step is to tune both receiver and oscillator to some point near 550 K.C. Here the alignment is made by adjusting the oscillator "pad" condenser for maximum response. It may be reached through hole in base between 1st detector and oscillator tubes. If necessary to adjust the two R.F. condenser sections it may be done by bending the slotted condenser rotor end plates. If necessary to align at points other than the ends of the "band" it may be done by bending portions of these slotted plates. Alignment of the two ends of the scale is usually quite sufficient.

IMPORTANT: It is desirable to move the dial back and forth across the signal while making the above alignments. This is particularly necessary when altering any capacities connected with the oscillator circuit. Use an insulated or bakelite screw driver.

Be certain that good tubes are used in all sockets.

Alignment

This receiver may be aligned on a broadcasting station or oscillator It is advisable, however, to insert a dummy 56 tube which has one filament prong removed in the AVC socket, to prevent any AVC action from making determination of the output peak difficult. The intermediate frequency is 262 K. C. and the I. F. trimming condenser adjusting screws are accessible from beneath the chassis.

These chassis may be easily distinguished by keeping in mind that the No. 62-84 uses dual dynamic speakers, while the No. 62-94 uses a single dynamic. The No. 62-79 is the same in all respects as the No. 62-84, with the exception that this chassis uses chromatic tuning and, therefore, a different tuning condenser assembly and drive. The tone, volume, and noise suppressor control are also of slightly different values.

The chassis may be aligned either on the oscillator or a broadcasting station

When any defects are located in the Oscillator I.F. assembly, other than simple wiring breaks which are easily repaired, the entire unit should be replaced rather than attempting to replace any of the component parts. The replacement assembly will be supplied as a unit but none of the component parts can be supplied separately.

Aligning I.F. Condensers. During I.F. alignment, the oscillator should be rendered inoperative by shorting a portion of the oscillator coil. Connecting a wire jumper between the two vertical insulated terminals located near the base of the oscillator—I.F. assembly beneath the chassis will accomplish this.

General Description and Aligning Procedure

The tubes employed are as follows, and are operated at rated voltages and biases:

Oscillator and Mixer	57
Intermediate Frequency	58
Second Detector	55
Output	247
Rectifier	280

This receiver employs a combination oscillator and first detector, or mixer. The second detector is the new dual diode-triode, the diode portion acting as detector and providing automatic volume control—acting on the grid of the type 58 I.F. tube. The triode portion of the second detector is operated as an individually biased A.F. amplifier.

The first two variable tuned circuits are not electrically coupled. They are mutually coupled by being placed close together and left unshielded. In all other respects the circuits are entirely conventional.

In aligning, it is first desirable to see that the I.F. transformers are properly set. The First I.F. transformer is on top of the base and has two adjustments. The second is inside the base but its single adjustment may be reached through a hole in the rear-center of the base. The intermediate frequency is 175 K.C.

The tuning condenser may be adjusted for alignment or "tracking" of the tuned circuits by means of an oscillator and output meter. The oscillator should cover the band from 550 to 1500 K.C. The energy from the oscillator is coupled weakly into the antenna circuit—a simple means being to place the oscillator near the antenna wire. The receiver and oscillator are first tuned to approximately 1500 K.C., and by watching the output indicator, the three condenser trimmers are adjusted for maximum output. These three trimmers must then be left untouched for all further aligning.

The next step is to tune both receiver and oscillator to some point near 550 K.C. Here the alignment is made by adjusting the oscillator "pad" condenser for maximum response. It may be reached through hole in base near the first I.F. transformer. If necessary to adjust the two R.F. condenser sections, it may be done by bending the condenser end plates. If necessary to align at points other than the ends of the "band" it may be done by bending portions of the slotted end plates of the condenser rotor sections. Alignment of the two ends of the scale is usually quite sufficient.

Prices subject to change without notice.

IMPORTANT: It is desirable to move the dial back and forth across the signal while making the above alignments. This is particularly necessary when altering any capacities connected with the oscillator circuit. Use an insulated or bakelite screw driver. No aligning, other than the I.F. transformers, is necessary for the short wave band (75 to 200 meters) as no attempt has been made to tune more than the oscillator.

Be certain that a good 57 tube is used in the first socket.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the four intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the signal generator is, in this instance, connected to the antenna lead of the receiver. Keep the signal weak enough to prevent action of the A.V.C. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached from the top of the chassis and is between the I.F. and oscillator coil cans.

A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condensor rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

Line Voltage Range

The receiver will operate satisfactorily within a line voltage range of 28 to 36 volts. If the line voltage runs higher, it will have to be cut down and one method of doing this is to use a series resistor. Let us say the line voltage is 40. The receiver uses 1.55 amps. at 32 volts. A resistance of 5.16 ohms, therefore, capable of dissipating 12.4 watts will be required in the receiver line to cut the voltage down to 32. If the line voltage varies a variable resistor may be required.

IMPORTANT—POLARITY OF THE POWER SUPPLY TO THE RECEIVER MUST BE OBSERVED. There is a red mark on the plug. The prong of the plug at which the red mark is placed must be plugged into the positive side of the line. Use a receptacle on the 32 volt line from which the plug will not have to be removed after it has once been correctly inserted.

For Parts list, see P.15-53

Tube Voltages

All D.C. voltages taken with a 1000 ohm per volt meter on the scale indicated in column headed "Meter Scale." Turn on the volume control all the way and connect the antenna and ground leads together. The grid, plate, and screen grid voltages are measured to cathode of the heater tubes and to filament of the 245 tube.

NOTES

FIGURES OPPOSITE SOCKET PIN NUMBERS ARE VOLTAGES MEASURED WITH A 5000-OHMS-PER-VOLT METER BETWEEN SOCKET TERMINALS AND B- WHERE NO READING IS SHOWN VALUE IS ZERO.

LINE VOLTAGE 117 VOLTS AC.

VOLUME CONTROL AT MAXIMUM.

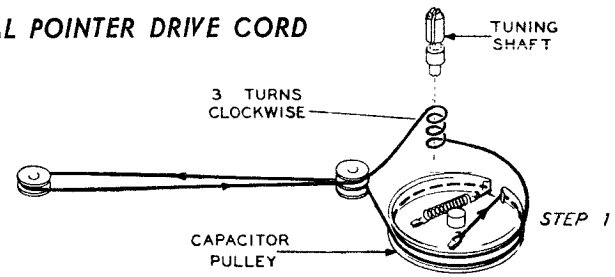
VOLTAGE AT PIN 5 OF 1A7GT CANNOT BE MEASURED WITH STANDARD VOLTMETER.

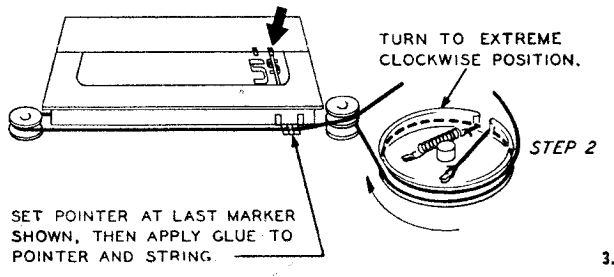
RESISTOR AND COIL VALUES ARE IN OHMS.

CAPACITOR VALUES ARE IN MF UNLESS OTHERWISE SPECIFIED.

IF PEAK 455 KC

REPLACING DIAL POINTER DRIVE CORD



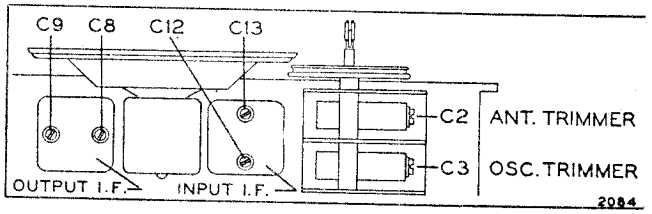


3.46

MODEL 64BR-1051A

MONTGOMERY WARD
ALIGNMENT PROCEDURE

- Output meter across 3.2 ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output.
- Reduce input as needed to keep output near 0.4 volts.



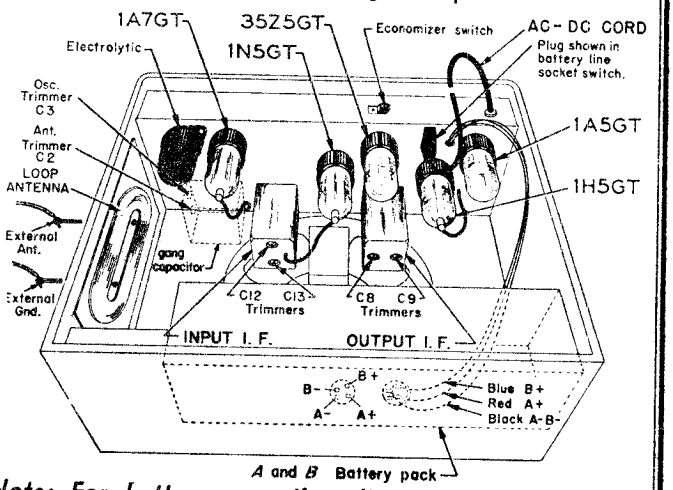
SIGNAL GENERATOR					
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	DIAL SETTING	ADJUST TRIMMERS TO MAXIMUM OUTPUT in order shown
455 kc	.1 mf	1A7GT grid cap*	1A7GT Pin 7	Rotor full open (plates out of mesh)	Input and output trimmers on IF cans
1650 kc	.1 mf	1A7GT grid cap*	1A7GT Pin 7	Rotor full open (plates out of mesh)	Osc. trimmer on gang (see trimmer view)
1400 kc	200 mmf	External antenna clip	External ground clip	1400 kc	Ant. trimmer on gang (see trimmer view)

*For these adjustments insert a 1 megohm resistor between loop antenna and 1A7GT grid cap.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivities at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output with speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of plus or minus 25% are usually permissible.



Note: For battery operation, line cord plug must be inserted in battery-line socket switch as shown; switch contacts are automatically moved.

SIGNAL GENERATOR				
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	INPUT FOR 50 MILLIWATT OUTPUT
1000 kc	200 mmf or RMA dummy antenna	External antenna clip	External ground clip	25 microvolts
1000 kc	.05 mf	Converter (1A7GT) grid cap	1A7GT Pin 7	140 microvolts
455 kc	.05 mf	Converter (1A7GT) grid cap	1A7GT Pin 7	100 microvolts
455 kc	.05 mf	IF amp. (1N5GT) grid cap	1A7GT Pin 7	4500 microvolts
400 cycles	.05 mf	AF amp. (1H5GT) grid cap	1A7GT Pin 7	.06 volts
400 cycles	.05 mf	Power amp. (1A5GT) grid (pin 5)	1A7GT Pin 7	3 volts

MODEL 64BR-1051A

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts DC or 50-60 cycle AC, 30 watts. Also made for 25 cycle AC. Battery: Wards Battery Pack No. 62-30 Size: 10-9/16" by 2¾" by 4¼". "A"—6 volts, 50 milliamperes. "B"—90 volts, 8.5 milliamperes.
Frequency Range	530 to 1650 kc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc, 48 kc at 1000 x signal.
Sensitivity	40 microvolts average for .05 watt output.
Power Output	80 milliwatts undistorted. 180 milliwatts maximum.
Loud Speaker	5", P.M., v.c. impedance 3.2 ohms.
Tube Complement	35Z5GT rectifier. 1A7GT converter. 1N5GT I.F. amplifier. 1H5GT detector, AVC, audio amplifier. 1A5GT output amplifier. T-47 pilot lamp, 6-8 volts.

MODELS 64BR-1205A, 1206A

ELECTRICAL SPECIFICATIONS

Power Supply	Battery: Wards Battery Pack 62-59 Size: 10¾"x 2⅝"x 6¼". "A"- 1½-volts, 250 milliamperes "B"- 90 volts, 10.5 milliamperes
Frequency Range	540 to 1700 kc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc, 49 kc at 1000 x signal
Sensitivity	40 microvolts average for 50-milli-watt output.
Power Output	0.120 watt undistorted. 0.140 watt maximum.
Loud Speaker	5-inch; P. M.; voice coil impedance 3.2 ohms.
Tube Complement	1R5, converter 1T4, I. F. amplifier 1S5, detector, AVC, audio 3S4, output amplifier

ALIGNMENT PROCEDURE

- Output meter across 3.2-ohm output load.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
- Volume control at maximum for all adjustments.
- Connect ground post of signal generator to radio chassis.

SIGNAL GENERATOR			TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT (in order shown)
Frequency	Coupling Capacitor	Connection to Radio		
455 kc	.1 mf	Grid (pin 6) of 1R5	Iron cores all the way out	Trimmers on output and input I. F. cans
1700 kc	.1 mf	Grid (pin 6) of 1R5	Iron cores all the way out	Oscillator trimmer C6
1700 kc	200 mmf	Antenna lead	Iron cores all the way out	Antenna trimmer C4
1400 kc	200 mmf	Antenna lead	Turn dial to 1400 kc	Adjust position of ant. coil (see coil view)*

*This adjustment and the previous adjustment are interlocking; therefore repeat the two adjustments alternately for best results.

NOTES

LETTERS AND FIGURES OPPOSITE SOCKET PIN NUMBERS ARE VOLTAGE READINGS TAKEN WITH A 5000-OHMS PER-VOLT METER BETWEEN SOCKET TERMINALS AND CHASSIS. BATTERIES AT FULL VOLTAGE ECONOMIZER SWITCH OPEN.

A - CANNOT BE MEASURED WITH ABOVE METER.

RESISTOR AND COIL VALUES SHOWN IN OHMS.

CAPACITOR VALUES SHOWN IN MFD UNLESS OTHERWISE INDICATED.

6-13-46

RECEIVER STAGE SENSITIVITIES

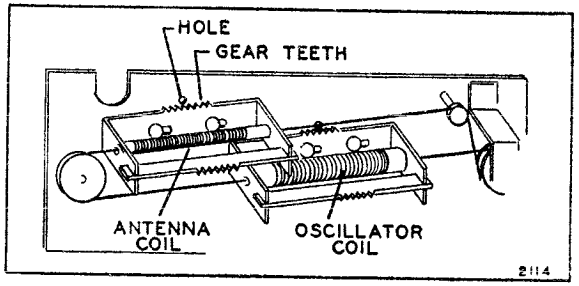
The table below lists the sensitivities at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with speaker connected.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 kc and 455 kc signals modulated 30% with a 400-cycle audio signal.

Variations in sensitivities of plus or minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	
1000 kc	200 mmf	External antenna lead	Chassis	45 microvolts
1000 kc	.1 mf	Converter 1R5 (pin 6)	Chassis	129 microvolts
455 kc	.1 mf	Converter 1R5 (pin 6)	Chassis	120 microvolts
455 kc	.1 mf	IF amp. 1T4 (pin 6)	Chassis	3400 microvolts
400 cycles	.1 mf	AF amp. 1S5 (pin 6)	Chassis	.027 volts
400 cycles	.1 mf	Power amp. 3S4 (pin 3)	Chassis	2.5 volts



View of Coil Assembly

The antenna coil asembly is movable left or right. When making the adjustment as required in the alignment procedure, move the coil assembly very slowly, either by hand or by pivoting one edge of a screwdriver blade in the hole and engaging the blade in the gear teeth of the coil form.

For other data, see P.15-63

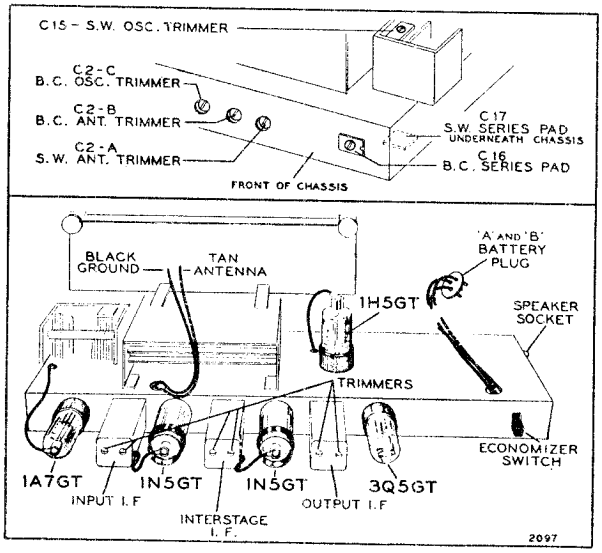
POINTER ALIGNMENT



View of Chassis and Trimmers

ALIGNMENT PROCEDURE

- Output meter across 3.2-ohm output load.
- Volume control at maximum.
- Tone control at maximum treble.
- Connect ground post of signal generator to ground lead of radio.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

BAND SWITCH SETTING	SIGNAL GENERATOR Frequency	Coupling Capacitor	Connection to Radio	TUNER SETTING	ADJUST TO MAXIMUM OUTPUT (in order shown)
BROADCAST *(counter-clockwise)*	455 kc	.1 mf	Second I.F. (1N5GT) grid cap	Rotor full open (plates out of mesh)	Trimmers on top of output I.F. can
	455 kc	.1 mf	First I.F. (1N5GT) grid cap	Rotor full open (plates out of mesh)	Trimmers on top of interstage I.F. can
	455 kc	.1 mf	Converter (1A7GT)	Rotor full open (plates out of mesh)	Trimmers on top of input I.F. can
SHORT WAVE *(clockwise)*	18.1 mc	400 ohms	Antenna lead	Rotor full open (plates out of mesh)	S.W. osc. trimmer C15
	16 mc	400 ohms	Antenna lead	16 mc* (see below for pointer alignment)	S.W. ant. trimmer C2-A
	6 mc	400 ohms	Antenna lead	6 mc (see below for pointer alignment)	S.W. osc. series pad C17†
BROADCAST *(counter-clockwise)*	1720 kc	200 mmf	Antenna lead	Rotor full open (plates out of mesh)	B.C. osc. trimmer C2-C
	1500 kc	200 mmf	Antenna lead	1500 kc (see below for pointer alignment)	B.C. ant. trimmer C2-B
	600 kc	200 mmf	Antenna lead	600 kc (see below for pointer alignment)	B.C. osc. series pad C16†

* First set signal generator to 16 mc; then, with gang all the way out, approach 16 mc by slowly rotating gang inward. The first signal is the one on which the alignment should be made. The next signal is the image; do not align on this signal.

† Turn the dial back and forth slightly (rock) and adjust padder until peak output is obtained. After this adjustment check previous adjustments for interlocking effects.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 kc for all readings on the standard broadcast band and to 10 mc for the short-wave readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of 0.4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. Variations in sensitivities of plus or minus 25% are usually permissible.

The volume control should be set at maximum, and the tone control at maximum treble.

SIGNAL GENERATOR				INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	
10 mc	400 ohms	Antenna lead	Ground lead	18 microvolts
1000 kc	200 mmf	Antenna lead	Ground lead	10 microvolts

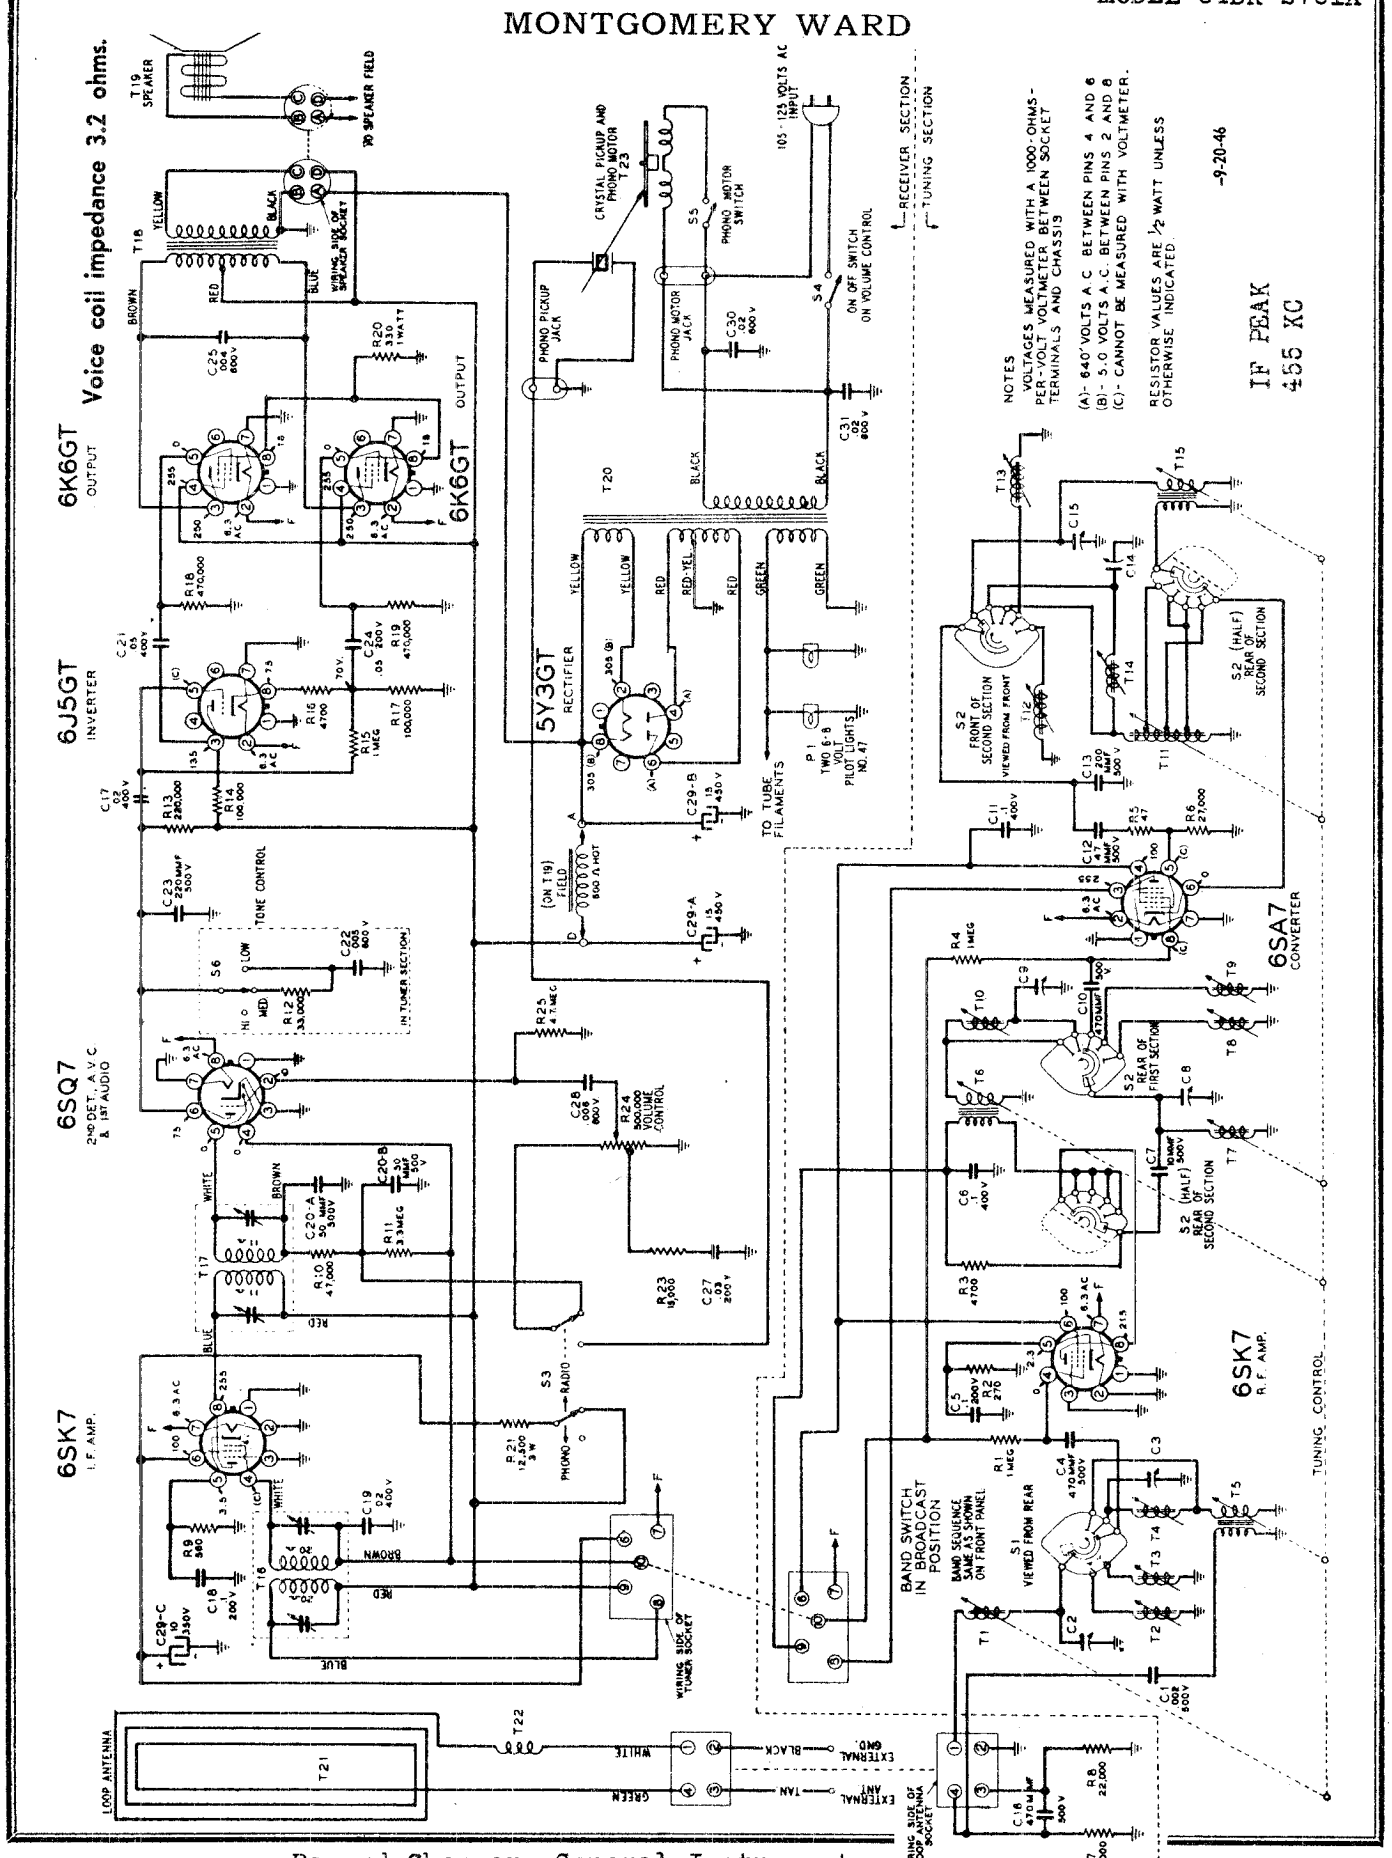
MODEL 64BR-2701A



MONTGOMERY WARD

ALIGNMENT PROCEDURE

MECHANICAL ADJUSTMENT—The core tuning bar (see illustration of coils below) and dial pointer must be adjusted mechanically before any electrical alignment is attempted. Rotate the manual tuning control until the core bar is farthest from the coils. For proper adjustment the bar should be approximately 1/32 of an inch from the two rod guide angles.

With the core bar in this position, adjust the dial pointer to coincide with 1600 kc on the dial scale

Rotate the core of each of the three broadcast coils (see illustration) until the end of the core is 1-5/32" from the end of the coil form. Rotate the three 9-mc cores until this dimension is 1-1/6" for these coils. After these adjustments have been made, the unit can be aligned electrically.

ELECTRICAL ADJUSTMENT—To align the set make the following preliminary adjustments: Set the tone pushbutton for treble tone; set the volume control at maximum; connect the ground post of the signal generator to the radio chassis; connect the output meter across a 3.2-ohm output load; and allow the receiver and signal generator to warm up for several minutes.

Align the set according to the sequence given in the chart. The indicated coupling capacitor is to be connected in series between the signal generator output lead and the receiver. Adjust the set for maximum output; reduce the input as needed to keep the output near 1.3 volts.

Locations of all the trimmers and coils are shown in the illustrations below. After adjustment, seal the coil cores with collodion or a similar substance (do not use cement).

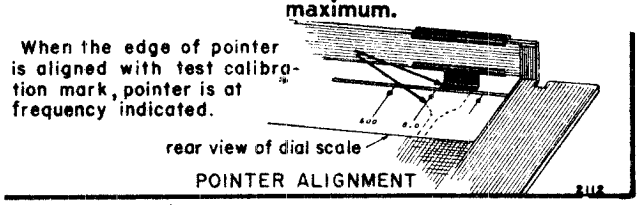
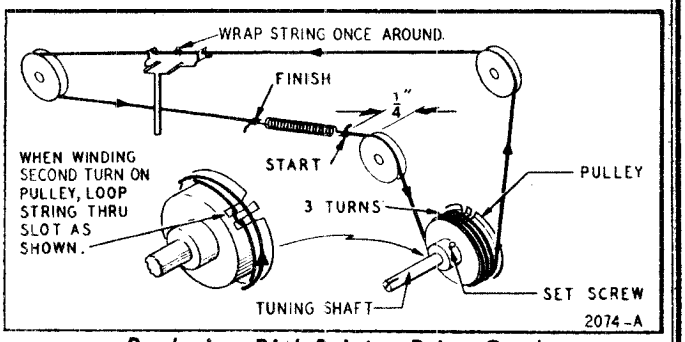
Frequency Ranges.....Broadcast band—540 to 1600 kc.
49-meter band—5.96 to 6.19 mc.
31-meter band—9.1 to 10 mc.
25-meter band—11.45 to 12.16 mc.
19-meter band—14.94 to 15.46 mc.
Intermediate Freq.....455 kc.
Selectivity.....at 1000 kc, 35 kc at 1000 x signal
Sensitivity.....3.75 microvolts average for ½ watt output.
Power Output.....5.5 watts undistorted, 7.5 watts maximum.



When the edge of pointer is aligned with test calibration mark, pointer is at frequency indicated.
rear view of dial scale
POINTER ALIGNMENT



Replacing Dial Pointer Drive Cord

After stringing, spring must be 1/4" from idler when tuning shaft is in extreme counterclockwise position. To do this: Loosen set screw; hold tuning shaft firm and turn pulley by hand until spring is 1/4" from idler; tighten screw.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivities at the inputs of various stages. All measurements are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. Variations in sensitivities of plus or minus 25% are usually permissible.

BAND	SIGNAL GENERATOR				INPUT FOR 500-MILLIWATT OUTPUT
	Frequency	Dummy Antenna	Connection to Receiver	Ground Connection	
Broadcast	1000 kc	200 mmf	External Antenna clip	Chassis	3.5 microvolts
	1000 kc	.1 mf	Grid (pin 4) of R. F. amp. (6SK7)	Chassis	8.9 microvolts

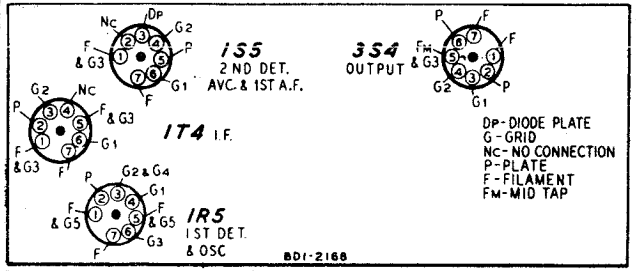
* IN MODEL 64WG-1050B, C-11 IS CONNECTED TO -B FROM PIN NO.1 OF 1R5 SOCKET INSTEAD OF TO CHASSIS GROUND.

IF PEAK 455 KC



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the filaments are between the socket terminal and the black or negative lead on C-17.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

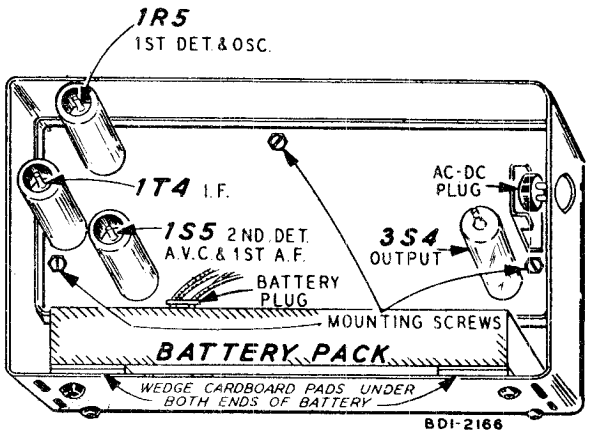
A variation of ±10% is usually permissible.

MODELS 64WG-1050A,
64WG-1050B

MONTGOMERY WARD

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of plus or minus 25% are usually permissible.



SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Freq.	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	.05 mf	1R5 Mixer Pin 6	C-17 Black Lead	148 microvolts
455 kc	.05 mf	1R5 Mixer Pin 6	Same as above	118 microvolts
455 kc	.05 mf	1T4 IF Amp. Pin 6	Same as above	5000 microvolts
400 cycles	.05 mf	1S5 2nd Det. Pin 6	Same as above	.068 Volts
400 cycles	.05 mf	3S4 Output Pin 3	Same as above	4.2 volts

Volume Confrol — Maximum All Adjustments.

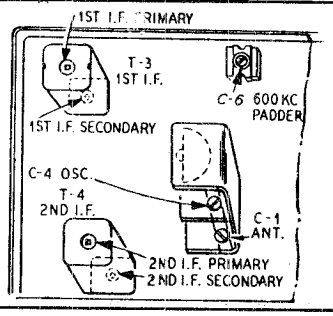
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning.

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter — Non-Metallic Screwdriver.

Dummy Antenna—.1 mf.



SIGNAL GENERATOR				RECEIVER	
Frequency Setting	Coupling Capacitor	Connection to Radio	Ground Connection	Condenser Setting	Adjust for maximum output. See trimmer illustration.
Remove chassis from case (See paragraph Removal of Chassis From Case) and temporarily solder a 50,000 ohm resistor across the two antenna leads on the chassis.					
455 kc	.1 mf	Control Grid 1R5—Pin 6	Chassis	Rotor to full open	1st IF Pri. & Sec. 2nd IF Pri. & Sec.
Remove temporary resistor, replace chassis in case and solder antenna leads to hinges.					
1610 kc	.1 mf	Door Hinge Above Tuning Control	Chassis	Rotor to full open	Oscillator (C-4)
1500 kc	.1 mf	Door Hinge Above Tuning Control	Chassis	Turn Rotor to Maximum Output	Set Tuning Knob at 1500 kc
1400 kc		Loop See Note A	Loop See Note A	Turn Rotor to Maximum Output	Antenna (C-1)
600 kc		Loop See Note A	Loop See Note A	Turn Rotor to Maximum Output	600 kc (C-6) Rock Rotor—See Note B
1400 kc		Loop See Note A	Loop See Note A	Turn Rotor to Maximum Output	Antenna (C-1)

NOTE A: Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place radio approximately 2 feet from loop.

NOTE B: Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

MODEL 64WG-1050A

To remove the chassis from the case it will be necessary to remove the line cord if connected, and the back panel from the case. Open the front cover and carefully remove the two control knobs and the screw on the front panel above the tuning knob at the side of the ON-OFF switch plunger. Withdraw the battery pack from the case and disconnect the plug connecting to the battery pack. Then remove the 3 chassis mounting screws protruding above the chassis as shown in the tube position illustration. Carefully lift the chassis, and move it over into the battery space. Unsolder the two antenna wires at the door hinges.

OPERATING VOLTAGES—Chassis for Model 64WG-1050A are available for operation on the following power supplies:

Power Line — 105-125 Volts AC 50-60 Cycles or 105-125 Volts DC

Battery — Wards Battery Pack No. 62-32 { A Section 1.5 Volts; B Section 60 Volts

REMOVAL OF CHASSIS FROM CABINET

Pull off the three control knobs and disconnect the battery plug. Unwrap the power cord from the radio at the top of the cabinet if necessary. Remove the four screws that fasten the chassis to the cabinet (2 on the outside at each end of the cabinet). Tip the chassis slightly forward and at the same time withdraw it from the cabinet.

Tube Complement
1 1R5 Mixer
2 1U4 I-F Amplifier
1 1S5 2nd Detector, AVC and 1st A-F Amplifier
1 3Q4 Power Output

OPERATING VOLTAGES—Chassis for Model 64WG-1052A are available for operation on the following power supplies:

Power Line — 105-125 Volts AC 50-60 Cycles or 105-125 Volts DC

Battery — Wards Battery { A Section 9 Volts; Pack No. 62-35 { B Section 90 Volts

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

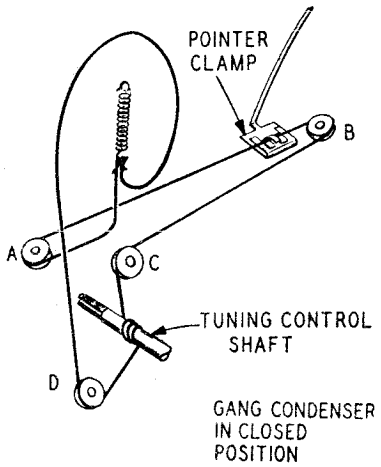
The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antenna—.1 mf., 50 mmf.

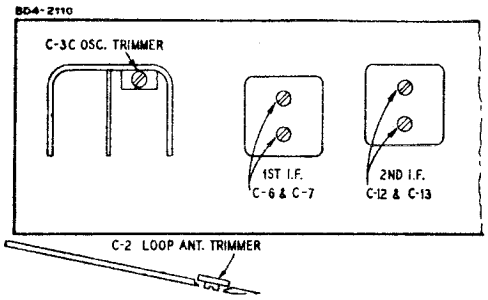
SIGNAL GENERATOR				CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM See Trimmer Illustration
Frequency Setting	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	.1 mf	Control Grid 1U4—1st I-F Pin 6	Point "X" At Electrolytic Capacitor Black Lead	Turn Rotor to full open	2nd I-F (C13) & (C12)
455 kc	.1 mf	Control Grid 1R5—Mixer Pin 6 See Note C	Same as above	Turn Rotor to full open	1st I-F (C7) & (C6)
1620 kc	.1 mf	Control Grid 1R5—Mixer Pin 6	Same as above	Turn Rotor to full open	Oscillator (C3C)
1400 kc	50 mmf	External Antenna Clip on Loop See Note A	External Ground connection on loop	Turn Rotor to Max. Output Set Indicator to 1400 KC See Note B	Antenna (C2)

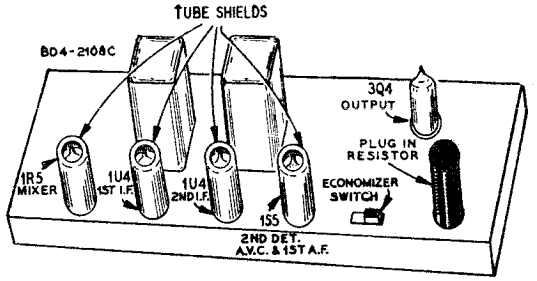


NOTE A—Re-assemble chassis in cabinet and close the cabinet back before making adjustment.

NOTE B—Tune in a 1400 KC signal. If pointer is not at the 1400 KC mark on the dial scale, move the pointer on the string to the 1400 KC mark.

NOTE C—Short out the oscillator section of the gang condenser for this adjustment only.





DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully closed position. Use a new cord 23" long and tie one end to the tension spring. Fasten the other end of the tension spring to the hook on the drive pulley. Pass the cord through the slot in the drive pulley rim and continue around pulley rim ¼ turn clockwise. Pass cord around pulleys A, B, and C as shown in the illustration. Wind three turns clockwise (viewed from rear of chassis) around tuning control shaft. The turns must progress toward rear of chassis. Pass cord around pulley D and continue ¾ turn clockwise around large drive pulley. Pass cord through the slot in the pulley rim then stretch the tension spring and tie free end of cord to it. Cut off any excess string.

MODEL 64 WG-1052A

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.
The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Output variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Chassis	20 microvolts
1000 kc	.05 mf.	1R5 Mixer—Pin 6	Point "X" (1S5 Pin 1)	30 microvolts
*455 kc	.05 mf.	1R5 Mixer—Pin 6	Same as above	15 microvolts
455 kc	.05 mf.	1U4 1st I-F—Pin 6	Same as above	440 microvolts
455 kc	.05 mf.	1U4 2nd I-F—Pin 6	Same as above	2200 microvolts
400 cycles	.05 mf.	1S5 1st A-F—Pin 6	Same as above	.022 volts
400 cycles	.05 mf.	3Q4 Output—Pin 3	Same as above	1.8 volt

*Short out the oscillator section of the gang condenser while making this measurement.

MODEL 54 WG-2007A

ELECTRICAL SPECIFICATIONS

Power Supply.....105-125 volts AC—60 cycles—30 watts (42 watts Phono Operating)

Frequency Range.....535 to 1620 KC

Intermediate Frequency.....455 KC

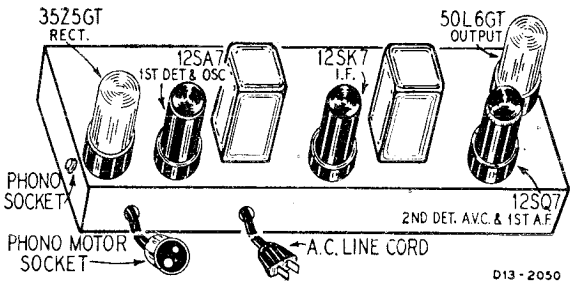
Selectivity.....55.5 KC broad at 1000 times signal, 1000 KC

Sensitivity (for .05 watt output) with external antenna.....25 microvolts average

Power Output.....1.5 watts maximum, .9 watt (10% distortion)

Loud speaker.....5" PM dynamic

Voice coil impedance.....3.2 ohms at 400 cycles



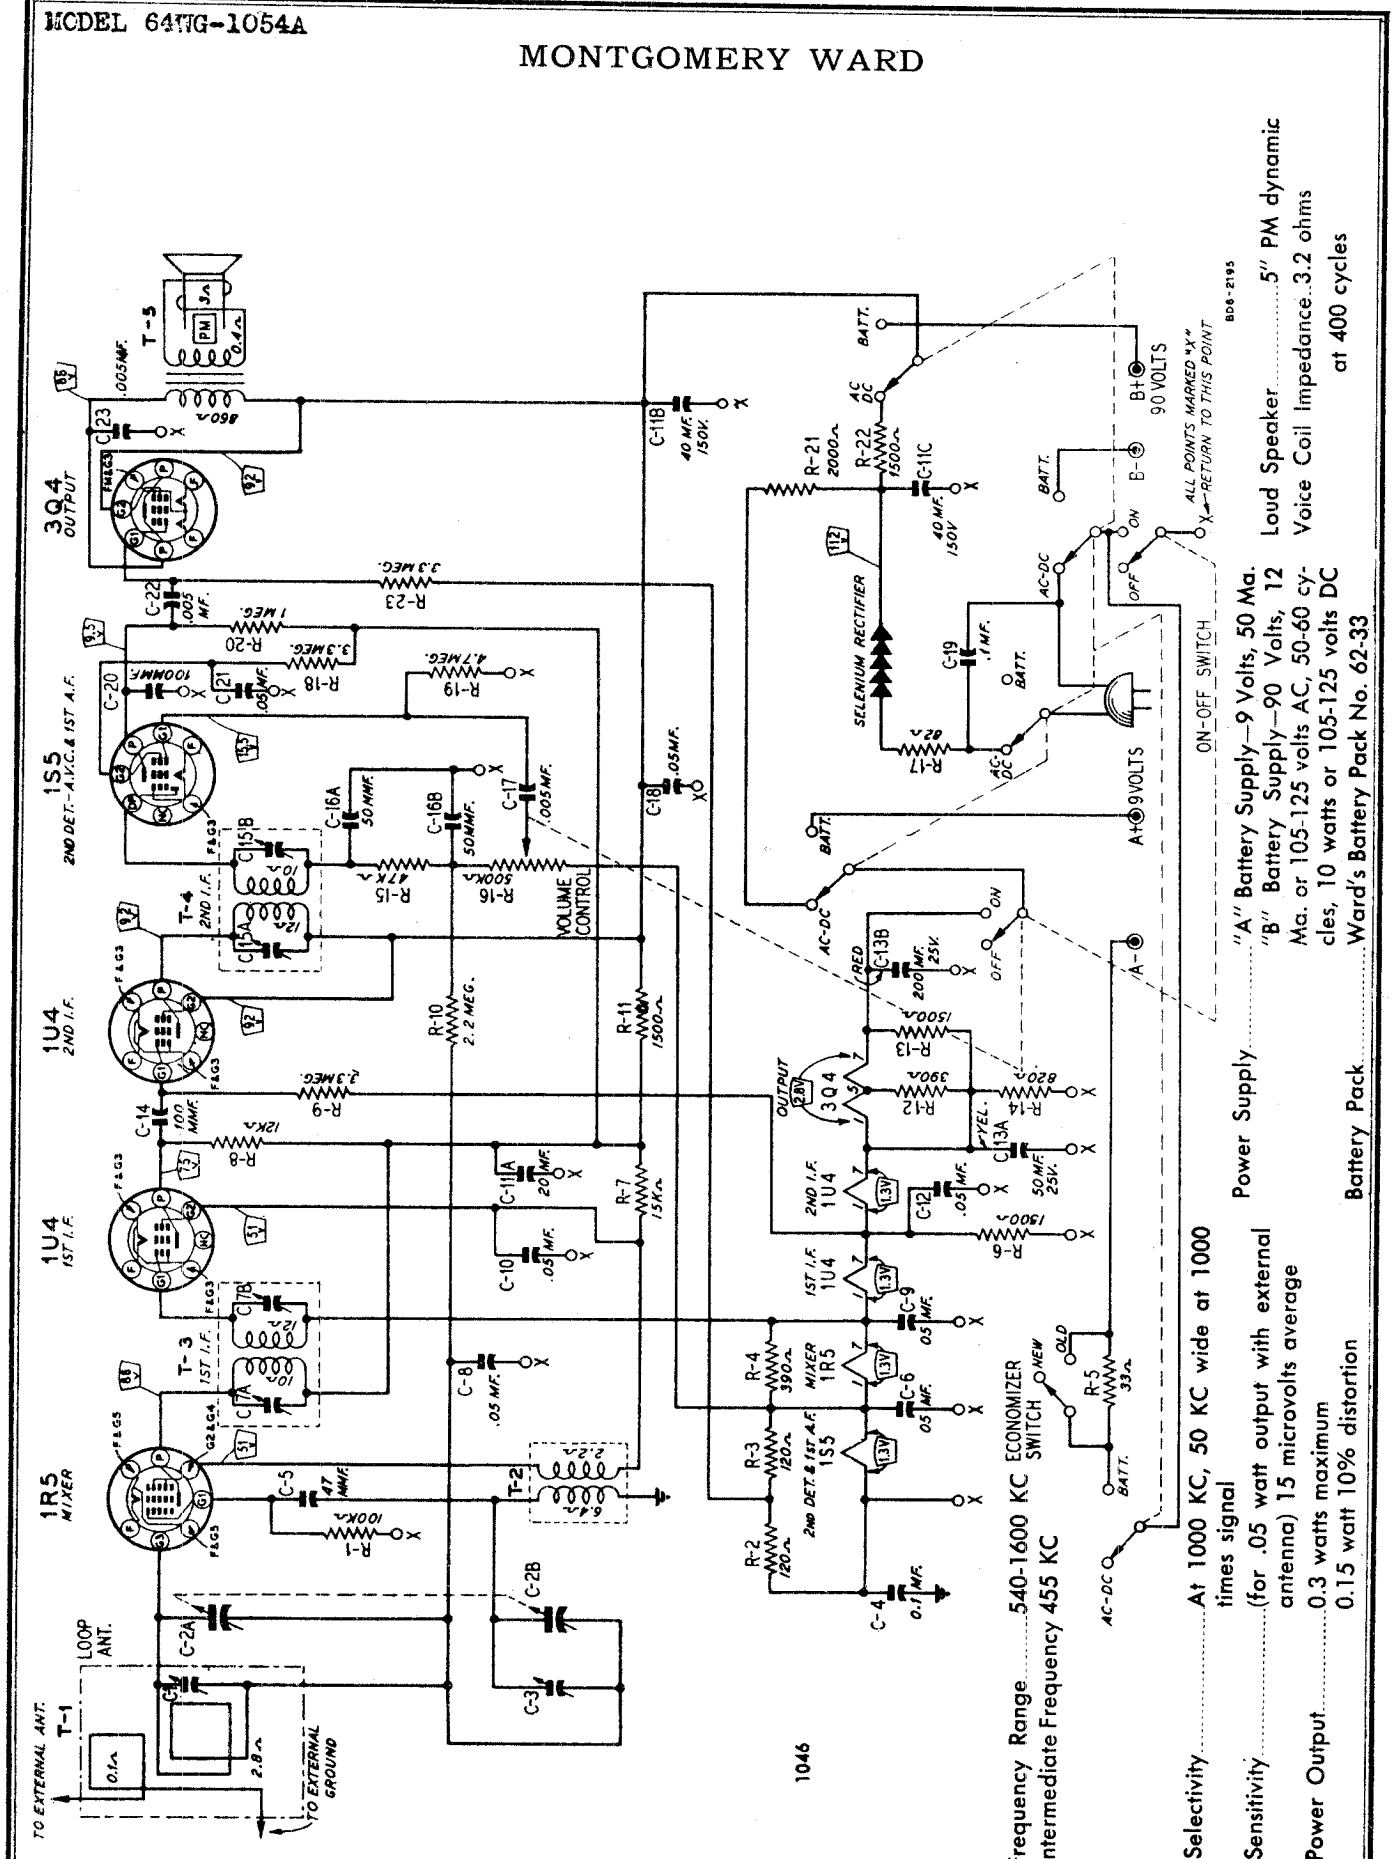
REMOVAL OF CHASSIS FROM CABINET

To remove the chassis from the cabinet it is necessary to pull the two control knobs and the dial pointer from their shafts. Remove the four screws in the bottom of the cabinet and the four snap pins that hold the cabinet back in place.

Care must be taken when removing the dial pointer that it is not damaged in such a manner that reinstallation will not be possible.

MODEL 64WG-1054A

MONTGOMERY WARD



Frequency Range.....540-1600 KC
Intermediate Frequency 455 KC

Selectivity.....At 1000 KC, 50 KC wide at 1000 times signal

Sensitivity.....(for .05 watt output with external antenna) 15 microvolts average

Power Output.....0.3 watts maximum
0.15 watt 10% distortion

Power Supply.....
"A" Battery Supply—9 Volts, 50 Ma.
"B" Battery Supply—90 Volts, 12 Ma. or 105-125 volts AC, 50-60 cycles, 10 watts or 105-125 volts DC

Loud Speaker.....5" PM dynamic
Voice Coil Impedance..3.2 ohms at 400 cycles

Battery Pack.....Ward's Battery Pack No. 62-33

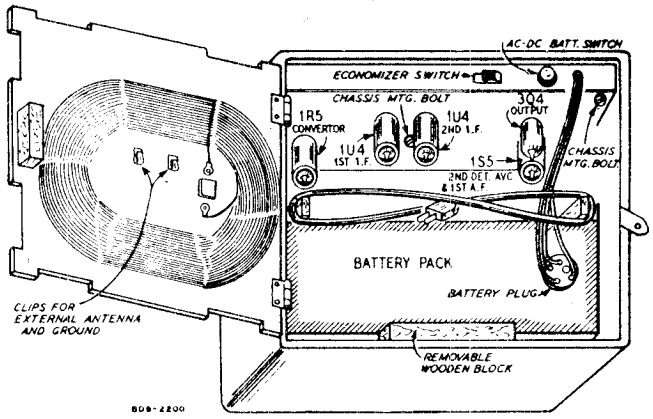
MODEL 64WG-1054A

MONTGOMERY WARD

REMOVAL OF CHASSIS FROM CABINET

To remove the chassis from the cabinet, it is necessary to pull off the 2 control knobs, disconnect the battery and then unscrew the 2 screws fastening the chassis to the cabinet. (The 2nd I-F Tube must be removed in order to reach the mounting screw in the center of the chassis.) See the tube position illustration for the location of these screws. After these screws have been removed, carefully pull out the chassis taking care not to damage the connections to the loop antenna.



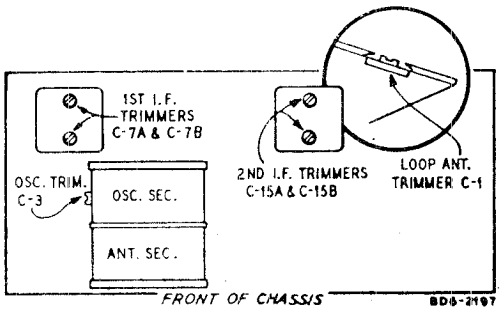
TUBE SOCKET VOLTAGES

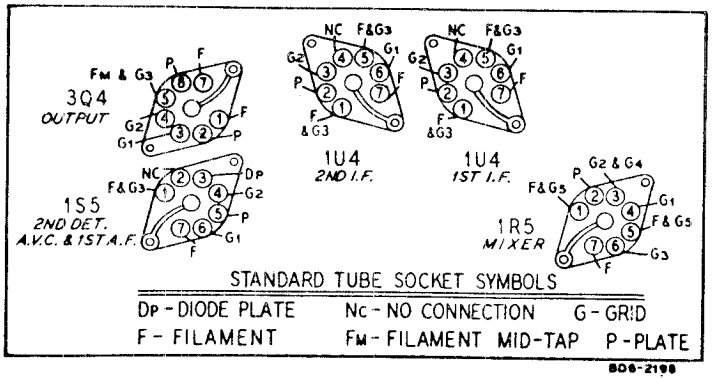
Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the filaments are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

A variation of ±10% is usually permissible.





SIGNAL GENERATOR				CONDENSER SETTING	ADJUST TRIMMER TO MAXIMUM See Trimmer Illustration
Frequency Setting	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	.1 mf	Control Grid 1U4 1st I-F Pin 6	Point "X" At Electrolytic Capacitor Black Lead	Turn Rotor to full open	2nd I-F (C-15A) & (C-15B)
455 kc	.1 mf	Antenna Wire connecting to Stator of Antenna Section of Tuning Condenser	Same as above	Turn Rotor to full open	1st I-F (C-7A) & (C-7B)
1620 kc	.1 mf		Same as above	Turn Rotor to full open	Oscillator (C-3)
1400 kc	50 mmf	External Antenna Clip on Loop See Note A	External Ground connection on loop	Turn Rotor to Max. Output Set Indicator to 1400 KC See Note B	Antenna (C-1)

NOTE A—Re-assemble chassis in cabinet and close the cabinet back before making adjustment.

NOTE B—Tune in a 1400 KC signal. If pointer is not at the 1400 KC mark on the dial scale, pull pointer off shaft. Set pointer at the 1400 KC mark and push back on shaft.

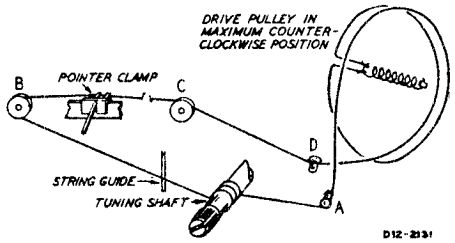
DRIVE CORD REPLACEMENT

Turn the large drive pulley counterclockwise to the stop position. Use a new drive cord 36" long and tie one end to the tension spring. Hook the other end of the tension spring over the tab on the drive pulley. Pass the cord through the slot on the drive pulley rim and continue around pulley 1¼ turns counterclockwise. Pass cord around stud A and wind three turns clockwise (from front of chassis) around the tuning shaft. Turns must progress away from chassis. Run the cord in front of the string guide, then pass cord around pulleys B and C and stud D. Pass cord under drive pulley and wind ¾ turn counterclockwise around drive pulley. Stretch tension spring and tie free end of cord to spring. Cut off any excess string.

Note: On sets having a black vinylite sleeve on the tuning shaft wind only two turns clockwise around the tuning shaft.

Attach the dial pointer to the cord and position, as instructed in paragraph DIAL CALIBRATION.

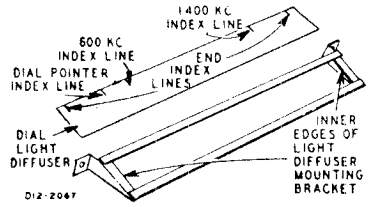


DIAL CALIBRATION

In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two end index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, adjust the radio to the stop position at the low frequency end of the dial. The dial pointer should be directly over the dial pointer index line (see illustration). If not, move the pointer along the drive cord until it is directly over the index line.

The 1400 KC index line is for use when aligning the receiver.



TUNING ASSEMBLY SERVICE

Exacting requirements in the tuning assembly make it impractical to replace the drive cord, coils and components in this assembly other than the trimmer condensers. Should the drive cord break, or components other than the trimmer condensers require service, the entire assembly must be ordered and replaced as a unit.

ALIGNMENT PROCEDURE

Check dial pointer position, see Dial Calibaration paragraph.

Volume Control--Maximum All Adjustments.

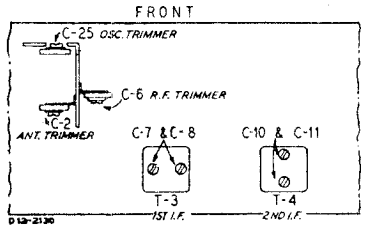
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.



NOTE A:—Index line is on dial light diffuser strip. See DIAL CALIBRATION paragraph.

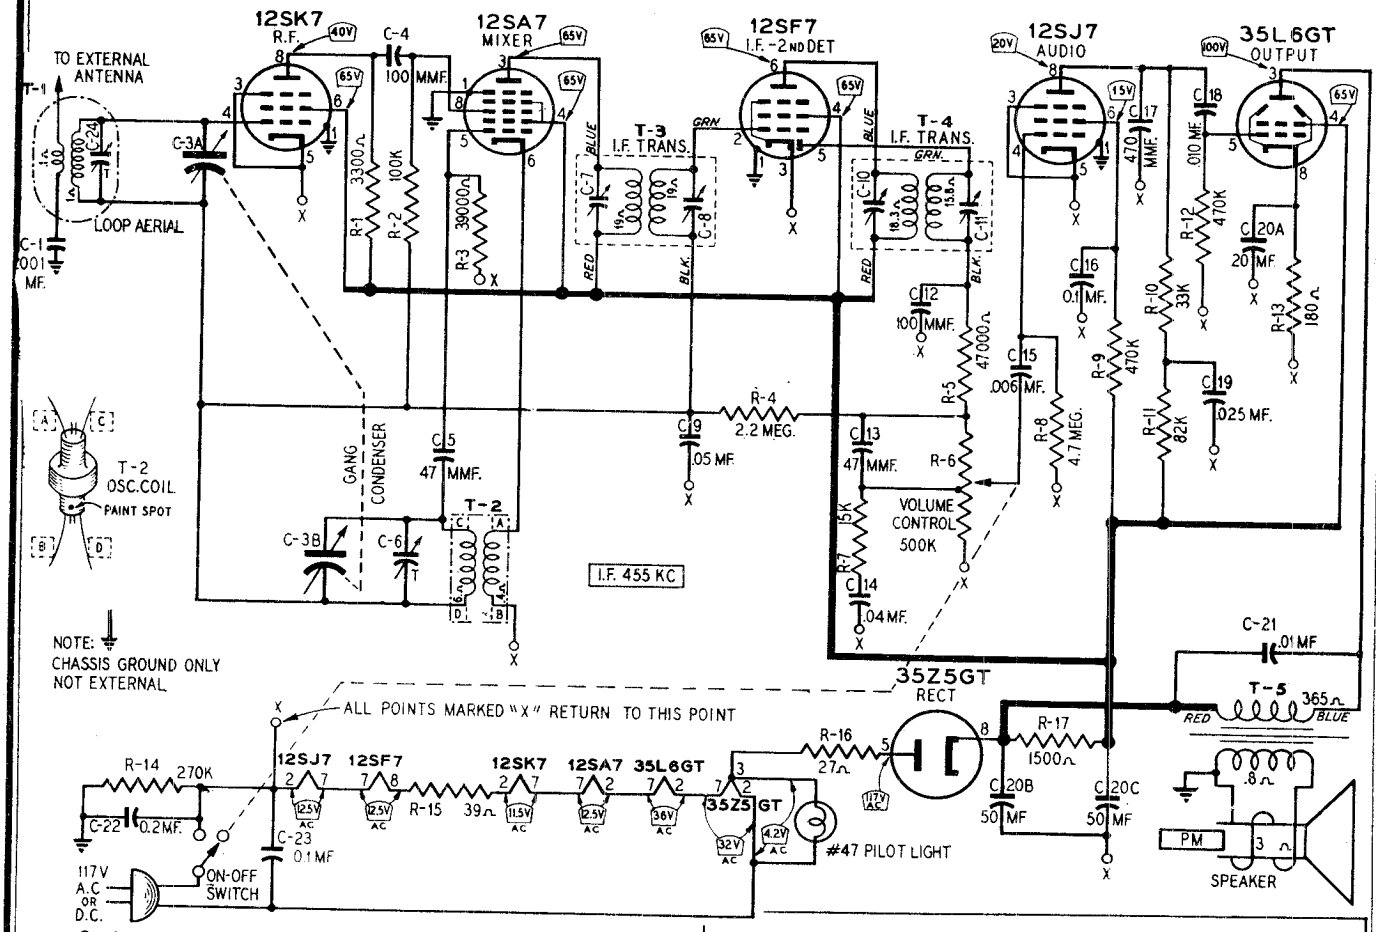
MODEL 64WG-1804A

MONTGOMERY WARD

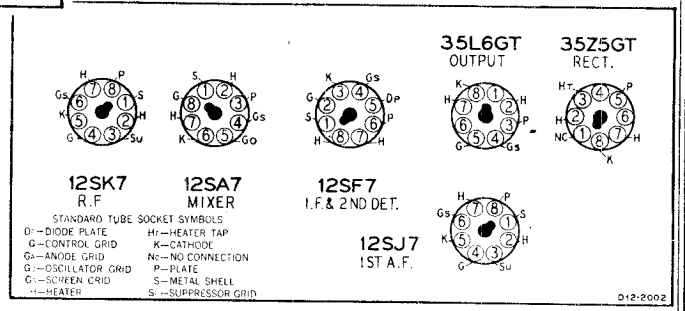


Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

A variation of +10% is usually permissible.



The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Chassis	19.5 microvolts
1000 kc	.05 mf.	12SA7 Mixer—Pin 8	Point "X" (12SK7 Pin 3)	150 microvolts
455 kc	.05 mf	12SA7 Mixer—Pin 8	Same as above	100 microvolts
455 kc	.05 mf	12SF7 I-F—Pin 2	Same as above	3500 microvolts
400 cycles	.05 mf	12SJ7 1st A-F—Pin 4	Same as above	.042 volts
400 cycles	.05 mf	35L6GT Output—Pin 5	Same as above	1 volt

MODEL 64WG-1804A

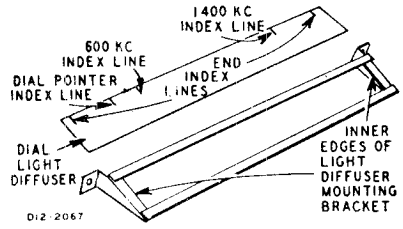
MONTGOMERY WARD

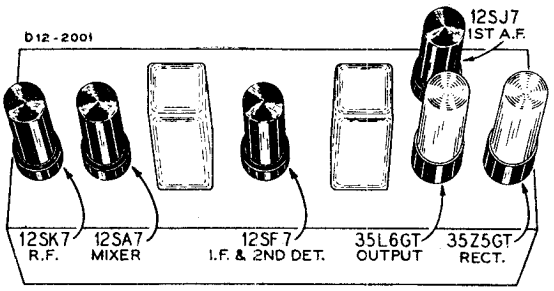
Power Supply.....105-125 volts AC, 50-60 cycles, 35 watts or 105-125 volts DC
Frequency Range.....535-1620 KC
Intermediate Frequency.455 KC
Selectivity.....At 1000 KC, 50 KC wide at 1000 times signal
Sensitivity.....(for .05 watt output with external antenna) 15 microvolts average
Power Output.....1.3 watts maximum
.75 watt 10% distortion
Loud Speaker.....4"x 6" PM dynamic
Voice Coil Impedance...3.2 ohms at 400 cycles

In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two end index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, turn the gang condenser to the fully closed position. The dial pointer should be directly over the dial pointer index line. (See illustration)

The 1400 KC index line is for use when aligning the receiver.

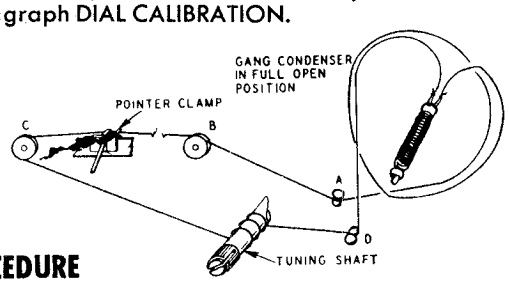




DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully open position. Use a new drive cord 36" long and tie one end to the tension spring. Hook the other end of the tension spring over the tab on the drive pulley. Pass the cord through the slot on the drive pulley rim and continue around pulley ½ turn counterclockwise. Pass cord around stud D and wind three turns clockwise (from front of chassis) around the tuning shaft. Turns must progress away from chassis. Pass cord around pulleys C and B and stud A. Pass cord under drive pulley and wind 1½ turns counterclockwise around drive pulley. Stretch tension spring and tie free end of cord to spring. Cut off any excess string.

Attach the dial pointer to the cord and position as instructed in paragraph DIAL CALIBRATION.



ALIGNMENT PROCEDURE

Check dial pointer position, see Dial Calibration paragraph.

Volume Control—Maximum All Adjustments.

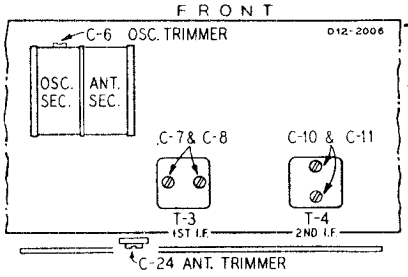
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.



NOTE A:—Index line is on dial light diffuser strip. See DIAL CALIBRATION paragraph.

MONTGOMERY WARD

MODEL 64WG-1807A

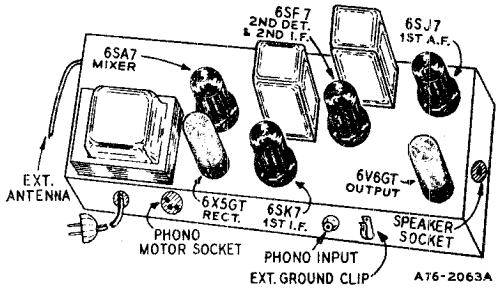
Selectivity.....40 KC broad at 1000 times signal, 1000 KC

Sensitivity.....(for .5 watt output) with external antenna
B range—9 microvolts average
D range—20 microvolts average

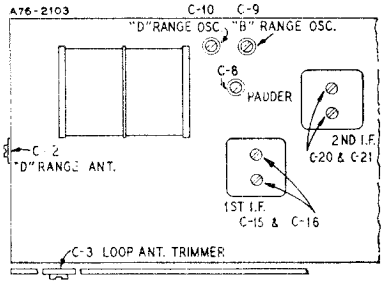
Power Output.....4 watts maximum
2.3 watts, 10% distortion

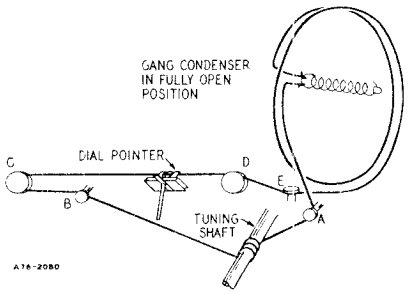


DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully open position. Use a new drive cord 46" long and tie one end to the tension spring. Hook the other end of the tension spring to the tab on the drive pulley. Pass the cord through the slot in the drive pulley rim and continue one half turn counterclockwise around the drive pulley. Then pass the cord around idler stud A and wind three turns clockwise around the tuning shaft (turns must progress away from chassis). Pass cord over idler stud B, around pulleys C and D and around idler stud E. Wrap cord counterclockwise around drive pulley, stretch the tension spring and tie free end of the cord to spring. Cut off any excess string.

TRIMMER POSITIONS





DRIVE CORD DIAGRAM

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR		Dummy Antenna	Band Switch Setting	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
	Frequency Setting	Connection at Radio				
I-F	455 kc	6SA7, Pin 8	.1 mf	B Range	Turn Rotor to Full Open	2nd I-F (C-20) & (C21) 1st I-F (C15) & (C16)
RANGE B	1620 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 kc	Antenna Lead	100 mmf	B Range	Tune Rotor to Max. Output Set Indicator to 1400 KC See Note A	Antenna Range B (C3)
	600 kc	Antenna Lead	100 mmf	B Range	Tune Rotor to Max. Output	600 kc (C8) Rock Rotor—See Note B
Repeat above oscillator adjustments at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement in output.						
RANGE D	15.6 mc	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	14 mc	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Antenna Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 kc	Antenna Lead	100 mmf	B Range	Tune Rotor to Max. Output	Antenna Range B (C3)

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, re-set pointer at the 1400 KC mark on the dial scale.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

MODEL 64 WG-1807A RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

*25X1539 Radio-Phono Switch Lever (When 40X280 is used)
*2A161 D.P.D.T. Switch (When 40X280 is used)
†12A461 6" P.M. Speaker Complete with Output Transformer

MODEL 64 WG-2009A RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Chassis	15 microvolts
1000 kc	.05 mf.	12SA7 Mixer—Pin 8	Point "X" (12SK7 Pin 3)	100 microvolts

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all plate and screen voltages read on a 500 volt scale.

Conditions of measurement are:

Line voltage	117 volts AC
Volume control	maximum
Signal input	none

Power Supply	105-125 volts AC, 60 cycles, 35 watts (55 watts phono operating)
Frequency Range	540-1600 KC
Intermediate Frequency	455 KC
Selectivity	At 1000 KC, 50 KC wide at 1000 times signal
Sensitivity	(for .05 watt output with external antenna) 15 microvolts average
Power Output	1.3 watts maximum .75 watt 10% distortion
Loud Speaker	4"x6" PM dynamic
Voice Coil Impedance	3.2 ohms at 400 cycles

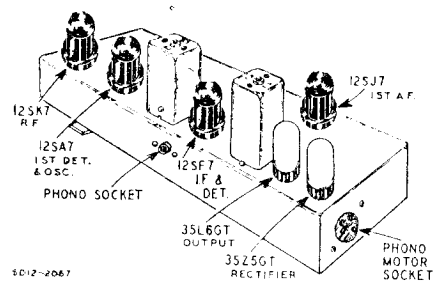
MODEL 64WG-2009A

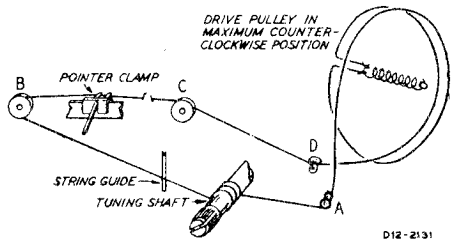
MONTGOMERY WARD



DRIVE CORD REPLACEMENT

The illustration below shows the method of stringing the drive cord. Use a new drive cord 40" long and tie one end to the tension spring. Hook the other end of the tension spring over the tab on the drive pulley. Pass the cord through the slot in the pulley rim and continue counter-clockwise around the pulley as shown. Three turns must be wound around the tuning shaft in a clockwise direction with the turns progressing away from the chassis. (On sets with a black vinylite sleeve on the tuning shaft, wind only two turns around the shaft).

Attach the dial pointer to the cord and position, as instructed in paragraph DIAL CALIBRATION.

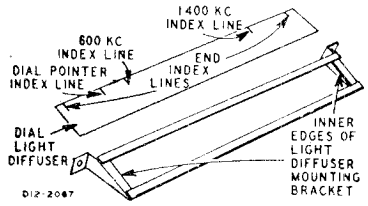


DIAL CALIBRATION

In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two end index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped to prevent movement of the diffuser strip. To position the dial pointer, adjust the radio to the "stop" position at the low frequency end of the dial. The dial pointer should be directly over the dial pointer index line. (See illustration.) If not, move the pointer along the drive cord until it is directly over the index line.

The 1400 KC index line is for use when aligning the receiver.



TUNING ASSEMBLY SERVICE

Exacting requirements in the tuning assembly make it impractical to replace the drive cord, coils and components in this assembly other than the trimmer condensers. Should the drive cord break, or components other than the trimmer condensers require service, the entire assembly must be ordered and replaced as a unit.

50 CYCLE OPERATION

If it is desired to use the radio and record player on a 50 cycle power supply, it will be necessary to install a new bushing on the motor shaft and to wire a 70 ohm, 20 watt resistor in series with the motor and the AC supply.

To install the new bushing, align the upper part of the center spindle with the lower part of the spindle and turn the record shelf to the 12" position. Lift the turntable off the record changer. On record players having a turned metal bushing fastened on with a set screw, loosen the set screw holding the old bushing to the motor shaft, remove the old pulley and install the new bushing No. G-25-72438.

On record players having a spring bushing on the motor shaft, remove the old spring bushing and install a new spring bushing No. G-33-72435.

On record players having no bushing on the motor shaft, install a spring bushing No. G-33-72436.

When replacing the turntable on the record player, make certain that the turntable rim is placed over both of the rubber drive puileys.

ALIGNMENT PROCEDURE

Check dial pointer position, see Dial Calibration paragraph.

Volume Control—Maximum All Adjustments.

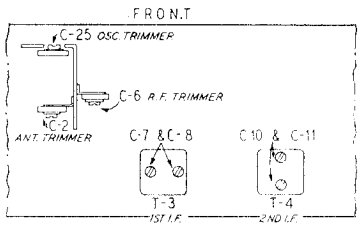
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.



NOTE A:—Index line is on dial light diffuser strip. See DIAL CALIBRATION paragraph.

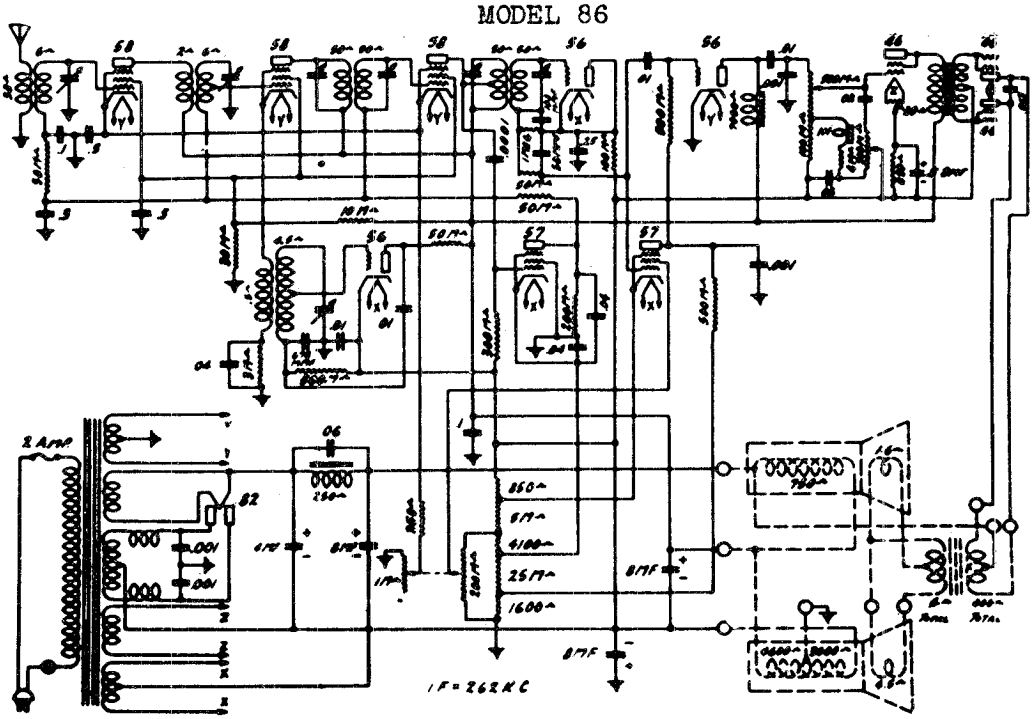
MODEL 86



MODELS 3035, 3037, 3065, 3067

R.F. Coils

Four coils are used in the chassis, and although they appear to be the same, there are three types and they cannot be interchanged.

To remove any one of the coils, remove the condenser shield, unsolder the wire leading from the condenser stator to the coil lug, remove the bottom plate of the chassis and bend out the three clips which hold the coil shield. Unsolder the leads to the coil and bend the clips holding the coil so that it may be removed. Handle any radio frequency coils carefully so the inside primary coil is not bent out of position. If this happens the receiver will oscillate. You will notice a white wire wound one-quarter turn around the grid end of the secondary having one end soldered to the plate side of the primary. This wire acts as an R.F. coupling condenser and is shown in the schematic diagram Fig. 1 as a condenser. Unless the chassis is damaged it is very rarely that an R.F. coil has to be replaced.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

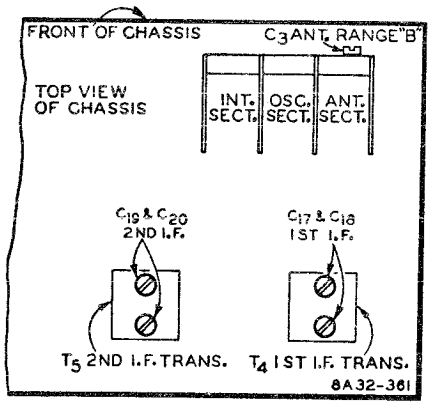
Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

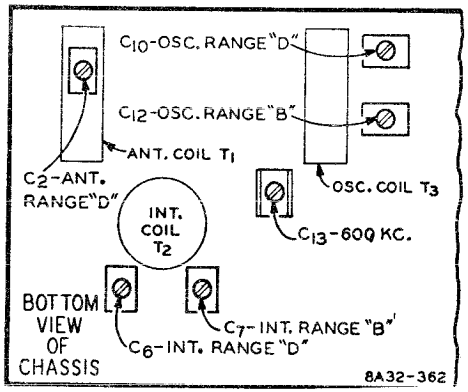
SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F.					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C17) & (C18) 2nd I.F. (C19) & (C20)
RANGE B					
1730 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C12)
1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set indicator to 1500 KC— See Note A	Ant. Range B (C3) Int. Range B (C7)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C13) Rock Rotor—See Note B
RANGE D					
18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
18,300 KC	Antenna Lead	400 Ohm	D Range	Keep Rotor at Full Open Position	Ant. Range D (C2) Int. Range D (C6) Rock Rotor—See Note B

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the indicator is not at 1500 KC, it will be necessary to re-calibrate. Loosen the set screw on the dial hub near the volume control drum. Hold the tuning control drum stationary and at the same time turn the dial drum the necessary amount in the required direction. Retighten the set screw.





Tubes

The type and position of each tube are shown in the illustration.

To replace the tuning eye tube, BE SURE THE RADIO IS TURNED OFF. Pull out the escutcheon cap which partially covers this tube. First loosen the tuning eye tube in its socket by moving it up and down and from one side to the other. At the back of the cabinet will be seen a "U" shaped tube puller attached to a cord. Place the open ends of the tube puller over the tuning eye tube and push the puller in as far as it will go. Compress the puller until the hooked end grips under the base of the tube and then pull the tube out.

Power Supply

CAUTION — Unless otherwise marked, this radio must be operated on a 117 volt, 60-cycle AC supply only. Do not insert the plug of the power cord in the receptacle unless all tubes and the speaker plug are in their proper sockets. The power rating of this radio is shown on the tube arrangement label. Receivers of this model which are to be used on 25 cycle, 230 volt, or other service are so marked on this label. If there is any doubt regarding the voltage and frequency of the power supply, consult the local power company before inserting the plug.

MODELS 93WG-800,-800A, -800B,-800C,-809, -809A.-809B, -809C

Procedure for Setting the Station Buttons

Selecting the Stations to be Set

There are 6 buttons on the automatic tuning dial by means of which 6 stations may be set for quick tuning.

Make a list of your favorite stations, those which you tune in regularly. There may be any number up to and including 6 in this list.

It is better to list the station with the lowest kilocycle number first, the station with the next higher kilocycle number next, and so on.

Any button may be used for any station you can receive, although it will be more convenient to set the stations so that the kilocycle numbers increase from left to right.

Setting a Station Button

Turn the manual tuning control so that the dial moves toward 1700 KC until the stop is reached.

At the right side of the escutcheon (from the front) will be seen a cap which covers a hole in the escutcheon —See illustration. Pull off this cap.

At the end of the tube in back of the hole in the escutcheon is the locking screw. Using a small handle screwdriver, unlock the mechanism by turning this screw in a counter-clockwise direction several turns.

TO SET STATIONS ACCURATELY, DO NOT JAR THE RADIO OR BUTTONS WHILE THE MECHANISM IS UNLOCKED.

Select the first station from the list you have prepared, and carefully tune in this station by means of the manual tuning control using the tuning eye as a guide.

With one hand, hold the manual tuning control to prevent it from turning and with the other hand, push one of the station buttons shown in the illustration *all the way in.* It is better to start with button No. 1.

Hold *this* button all the way *in.* With the other hand, see whether or not this station is still accurately tuned in by moving the tuning control a slight amount back and forth while observing the tuning eye. *Be sure to hold the button all the way in.*

Release the button slowly after the station is tuned in.

CAUTION—Do not touch this button again while the mechanism is unlocked as the setting may be altered.

Carefully tune in the second station on your list. Then hold the tuning control and push the second button slowly and firmly all the way in. Check for accurate tuning.

Proceed in the same manner to set any additional stations on your list on the remaining station buttons.

After all the stations are set, it will be necessary to lock the mechanism so that the settings will not change. Turn the manual tuning control so that the dial moves toward 1700 KC until the stop is reached. Then, with a SMALL HANDLE screwdriver, turn the locking screw in a clockwise direction until it is tight. Tighten the locking screw firmly but not excessively to avoid stripping the threads. Replace the cap over the hole.

Remove the correct station call letter tabs from the sheets supplied by bending the sheet back and forth at the score mark until the tab can be broken off. Press the tab all the way to the bottom of the space provided in the button. Cover the call letter tab with a celluloid tab, pressing this in until it snaps into place.

If at any time you wish to change the setting of a button from one station to another, repeat the above procedure. Changing the setting of one button will not affect the setting of any of the other buttons.

SPECIFICATIONS

Power Consumption 71 Watts (At 117 volts 60 cycles)

Power Output - - - - - - - 3.0 Watts Undistorted, 4.5 Watts Maximum

Selectivity - - 35 KC Broad at 1000 times Signal

Intermediate Frequency - - - - - - - 456 KC

Speaker - - - - - - - - - 8" Electro dynamic

Tuning Frequency Range

B Range..... 528 to 1730 KC
D Range.....5750 to 18300 KC

Sensitivity (For 0.5 watt output)

B Range.....2.0 Microvolts Average
D Range.....4.0 Microvolts Average

Voltages at Sockets

The voltages at sockets are shown on the schematic circuit diagram. Unless otherwise specified, the voltage indicated is between the socket terminal and ground.

These voltages are read under the following conditions:

Line Voltage—117.

Volume Control—Maximum.

Antenna Shorted to Ground.

Readings taken with 1000 ohm-per-volt meter. Plate and screen voltages are read on 500 volt scale.

DIAL ADJUSTMENT:

Mount control head to steering column by means of bracket and strap or under dash by means of bracket or to instrument panel (see illustrations). Attach cables as above. Tune set to some station of a known frequency (between 800 and 1200 K.C.), hold selector knob, then with a screw driver adjust the slotted screw on back of the control head, and in that way adjust the dial pointer to the correct frequency setting.

Part No.	Description	List Price Each
150-24	Selector Shaft—24"	1.50
151-2	Remote Control Head, less flexible shafts, less tone control and pilot assemblies, but with knobs and mounting hardware	4.50

MODEL 102

MONTGOMERY WARD

TUBE COMPLEMENT:

1—Type 6D6—remote cut-off pentode as an R. F. amplifier.
1—Type 6C6—pentode as an oscillator and first detector.
1—Type 6D6—remote cut-off pentode as an intermediate frequency amplifier (175 K.C.).
1—Type 75 —duplex diode triode second detector automatic volume control and first audio.
1—Type 42 —pentode output tube.
1—Type 84 —high vacuum full wave rectifier.

SERVICE NOTES:

Model 670 is a six tube superheterodyne receiver with an intermediate frequency of 175 kilocycles and a tuning range of from 530 to 1550 kilocycles.

This receiver has been carefully designed to facilitate servicing, the top and bottom covers are both removable, any part is replaceable without removing the chassis from the cabinet. All adjustments are made without removing the chassis from the cabinet.

Should it ever become necessary or desirable to re-align this receiver, the proper method is as follows:

I. F. ALIGNMENT:

1. With variable condenser at its maximum capacity position and with volume control full on, connect in series with a .1 mfd. condenser, an oscillator set at 175 kilocycles to the grid cap of the 6C6 tube.

2. Adjust trimming condensers of both input and output I. F. transformers, parts number 108-20 and 108-21 (see top view of chassis) to resonance with an oscillator, as indicated on an output meter connected across the primary terminals of the speaker input transformer or between the plate and screen terminals of the type 42 output tube. The connection to the tube can be made by means of an adapter. Maximum deflection on the output meter indicates resonance.

Note: Each I. F. transformer has two adjustments, both of these adjustments on both transformers are accessible through holes located in the back of the case between the two mounting plates and directly under the louvres.

R. F. ALIGNMENT:

1. Attach oscillator connected in series with a 200 mmfd. condenser to the antenna lead and with the variable condenser at its minimum capacity position (extreme right of its rotation) and with an oscillator set at 1550 kilocycles, adjust condenser trimmer of oscillator section (Front shaft end) to resonance.

2. Re-set oscillator to 1400 kilocycles, rotate variable condenser to pick up signal, adjust antenna (center section) and R. F. (rear section) trimmers to resonance.

3. Check alignment at 1500-1000-800-600-530 kilocycles by setting oscillator to these frequencies and picking up signal by rotating condenser.

4. Bend slotted plates of antenna and R. F. sections only if necessary. UNDER NO CIRCUMSTANCES BEND PLATES OF OSCILLATOR SECTION.

NOTES:

Voltages from chassis to different points are indicated on schematic circuit diagram, and should be measured with a voltmeter having a resistance of 1000 ohms per volt.

Failure to operate, noisy or weak reception, may be due to defective tubes or poor contact between cap on top of tube and grid clip.

Tubes may be checked by replacing with another tube which is known to be good.

If fuse blows out frequently, and insulating sleeve has been properly placed over fuse, the trouble probably is in the vibrator and vibrator should be replaced.

NEVER ATTEMPT TO ADJUST VIBRATOR POINTS.

Case rattles may be due to one or more of the following:

Loose screws in top or bottom covers. Loose elements in tubes. Loose tube shield. Loose R. F. coil shield. Loose grill cloth.

ALIGNING INSTRUCTIONS:

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a test oscillator, as well as an output meter, must be used.

DUMMY ANTENNAS:

The dummy antennas referred to in the following instructions are:

"I.F. Dummy" —A .1 mfd. condenser connected in series with the test oscillator output lead.

"Broadcast Dummy"—A 200 mmfd. condenser connected in series with the output lead of the test oscillator.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and the screen of the type 42 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

I.F. ALIGNMENT:

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 175 K.C., in series with I.F. dummy antenna, to the grid cap of the type 6A7 tube.
2. Adjust trimmer condensers of both input (108-33) and output (108-34) I.F. transformers to resonance with oscillator. See top view for location of these transformers. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver.

BROADCAST ALIGNMENT:

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. and in series with broadcast dummy, to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance (this adjustment is on the end section of the three gang condenser—see top view).
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust R.F. (center) and antenna (front) trimmers to resonance, see top view.

(a) Check for sensitivity at 1000, 800 and 600 K.C. by setting test oscillator to these frequencies and picking up the signal by rotating variable condenser. Under no circumstances bend plates of oscillator section, bend R.F. and antenna plates only if absolutely necessary.

DIAL ADJUSTMENT:

Tune set to some station of a known frequency (between 800 and 1200 K.C.) hold selector knob, then with a screw driver adjust the slotted screw on the back of the control head, and in that way adjust the dial pointer to the correct frequency setting.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

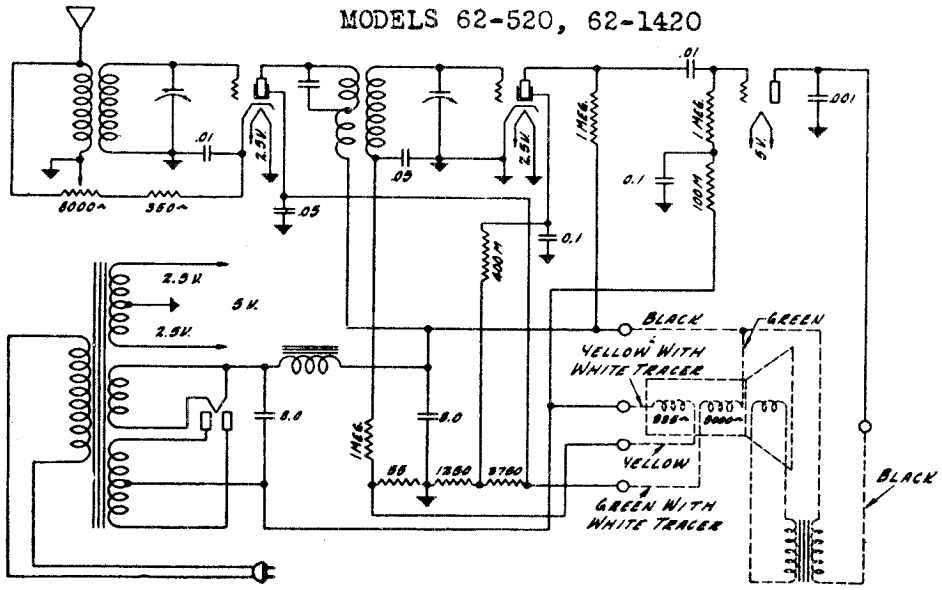
MONTGOMERY WARD

MODELS 62-520, 62-1420



DOTTED LINES SHOWN ARE IN SPEAKER.

2-31

The Model 20W chassis is the same in general design as the 26W chassis used in our five tube midgets, and the general servicing procedure is the same.

The tubes required are—

1—171 A power tube,
2—224 screen-grid tubes,
1—280 rectifier tube.

It is possible to substitute a 235 super control tube for the 224 tube used in the RF portion of this set. When this is done, the 235 super control tube should be used in the socket between the 280 rectifier and the 171 power tube.

MONTGOMERY WARD

MODEL 222

ALIGNING INSTRUCTIONS

Dummy Antennas

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3"

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Intermediate and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

Resonance Indicator:

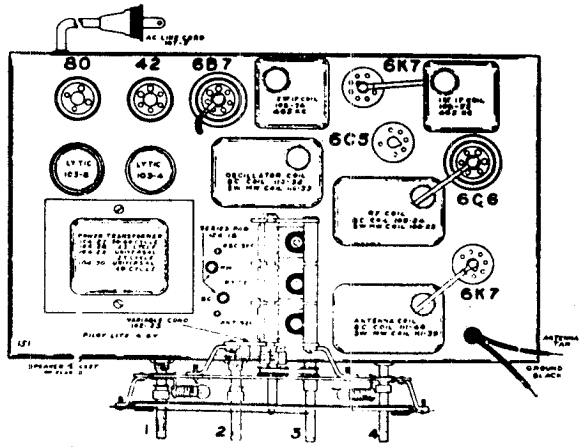
Use as a resonance indicator an output meter connected across the primary of the speaker input transformer or by means of an adapter between the plate and screen terminals of the type 42 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

ALIGNING I.F. TRANSFORMERS (465 K.C.)

Part No. 108-54 Output I.F. Transformer
Part No. 108-56 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the underside of chassis (see bottom view).

1. With volume control full on, (the extreme right of its rotation), the wave changing switch in the broadcast position, (extreme left of its rotation), the tone control on "Hi" part of the sharp position (as much right rotation as possible without operating the Hi Fidelity switch), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, located between the two I.F. transformers, and adjust the output I.F. transformer to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6C6 and adjust input I.F. transformer to resonance.
   (c) With oscillator still connected to 6C6, re-adjust output I.F. transformer.



ALIGNMENT PROCEDURE

The following adjustments to be made after the I.F.'s have been aligned as explained above.

BROADCAST BAND ALIGNMENT:

1. With wave changing switch, in the broadcast position, extreme left of its rotation, and with external oscillator set at 600 kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments:
   (a) Adjust broadcast series pad to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained. Note: This adjustment is accessible from the top of the chassis and is located between the variable condenser and the electrolytic condenser. See top view.
   (b) Re-set external oscillator to 1400 K.C., move dial pointer to 1400 K.C. and adjust oscillator (adjustment number 3), R.F. (adjustment number 2) and antenna (adjustment number 1) to resonance. See bottom view for location of these adjustments.
   (c) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

NOTE: IT IS EXTREMELY NECESSARY IN MAKING ALL OF THESE ADJUSTMENTS THAT THE FUNDAMENTAL OSCILLATOR SIGNAL BE TUNED IN AND NOT THE IMAGE FREQUENCY WHICH WILL FALL BELOW THE FUNDAMENTAL.

SHORT WAVE BAND ALIGNMENT:

1. With wave changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (adjustment number 8), short wave R.F. (adjustment number 7) and short wave antenna (adjustment number 6) to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check for sensitivity.

INTERMEDIATE BAND ALIGNMENT:

1. With wave changing switch in the intermediate wave position, center of its rotation, and with external oscillator set at 1800 K.C. and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Rotate variable condenser to approximately 1800 K.C., tune in oscillator signal and adjust M.W. series pad (see top view) to resonance. Slowly rock condenser to and fro while making this adjustment to be sure maximum output is obtained.
   (b) Set external oscillator at 5 M.C., rotate condenser, pick up signal and adjust intermediate wave R.F. (adjustment number 5), intermediate wave antenna (adjustment number 4) and intermediate wave oscillator (adjustment number 9) to resonance.
   (c) Re-check broadcast alignment and if it is found necessary to re-adjust either R.F. or antenna trimmers, repeat the 17 M.C. short wave and 5 M.C. intermediate wave adjustments.

MODEL 222

MONTGOMERY WARD

The tube complement of this chassis is as follows:

1—Type 6K7—remote cut-off pentode R.F. amplifier.
1—Type 6C6—pentode first detector.
1—Type 6C5—oscillator.
1—Type 6K7—remote cut-off pentode I.F. amplifier (465 K.C.)
1—Type 6B7 duplex diode pentode second detector, A.V.C. and audio.
1—Type 42—pentode output.
1—Type 80—high vacuum rectifier.

TUNING RANGE—

Standard Broadcast Band
535-1725 Kilocycles.

Intermediate Band
1720-5500 Kilocycles

Short Wave Band
5.5-18.1 Megacycles.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 125, 150, 220 and 250 volts (see instructions) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

INTERMEDIATE FREQUENCY 465 K.C.

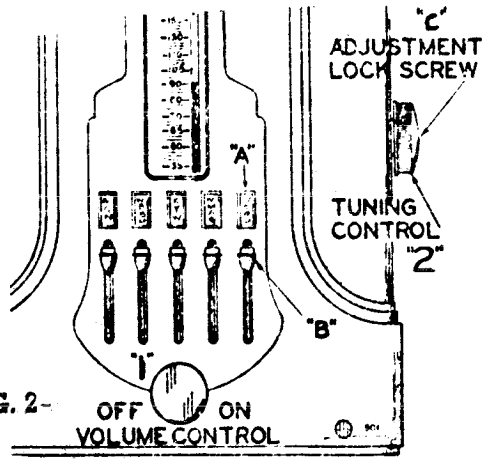

FIG. 2-

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are five levers on the dial by means of which five stations may be selected, (See "B" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including five.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

-6-38

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now hold tuning knob securely with left hand to prevent it from turning, or Rotate the tuning knob (No. 2) to the right (clockwise) as far is it will turn and with a coin (half dollar), tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

MODEL 559

MONTGOMERY WARD

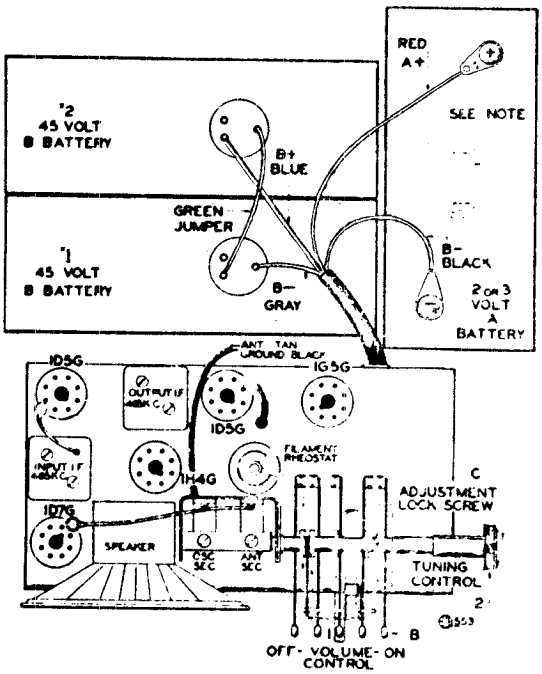

FIG. 1—TOP VIEW

DESCRIPTION:

TUBES:

The tube complement of this chassis consists of the following tubes:

1—Type 1D7G Pentagrid Mixer, First Detector-oscillator.

1—Type 1D5G. Remote Cut-off Pentode, I.F. Amplifier (465 K.C.)

1—Type 1H4G Triode Second Detector, A.V.C.

1—Type 1D5G First Audio Amplifier.

1—Type 1G5G Pentode Output Amplifier.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with a new set of batteries.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

The approximate current consumption is as follows:

"A"—360 ma., "B"—15 ma.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low battery voltage, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

(See part 5, for instructions on how to remove chassis from cabinet).

Connecting "A" Battery

First—Place the A Battery as shown in Fig. 1, (Either the 2 volt Storage A or the 3 Volt Dry A).

Next—Connect the Red wire marked A plus (+) to the A plus (+) Red post on battery.

Now—Connect the Black wire marked A minus (—) to the A minus (—) post on battery.

CAUTION: Before connecting a 3-volt dry A Battery, read the instructions which are attached to the bottom of the cabinet. NOTE: A special connector plug is supplied for connecting the "A" leads to a 3-volt dry "A" battery which has socket connections, (see dotted lines on "A" battery in Fig. 1).

Connecting "B" Batteries

First—Place both B Batteries exactly as shown.

NEXT—Insert the special three-prong connector plugs into the sockets on the B batteries as shown in illustration.

NOTE:—The above procedure and illustration pertains to the new style B batteries which have sockets; however, the old style B batteries which have terminals can be used by connecting them as follows:

FIRST—Remove the special plugs by cutting the wires off at the plugs.

NEXT—Connect grey colored B minus (—) wire to minus (—) terminal of battery (marked Battery No. 1 in illustration).

NEXT—Connect one end of green connecting wire to plus (+45) terminal of Battery No. 1 and other end to the minus (—) terminal of Battery No. 2.

NOW—Connect blue B plus (+) wire to the plus (+45) terminal of Battery No. 2.

All adjustments should be made with a non-metallic screw driver.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 1G5G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108112. Output I.F. Transformer.

Part No. 108111. Input I.F. Transformer.

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd condensor, to the control grid cap of the type 1D5G I.F. tube, and adjust the output I.F. transformer (No. 108112) to resonance.
   (b) Move oscillator output clip from grid of 1D5G to grid of 1D7G and adjust input I.F. transformer (No. 108111) to resonance.
   (c) With oscillator still connected to 1D7G. readjust output I.F. transformer (108112) if necessary.

R. F. ALIGNMENT: (535-1720 K.C.)

1. With the gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 100 mmf. condensor to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

Tubes are coded and guaranteed by the tube manufacturer.

Prompter service can be rendered on adjustments if defective tubes are returned direct to the tube manufacturer rather than through our factory.

All resistors are RMA color coded—specify value and/or resistor number (per schematic diagram) and model number.

When ordering condensers, specify part number, model number and/or capacitor (per schematic diagram) and model number.

Mica condensers are coded with an additional dot indicating tolerance:

Tolerence percent	Color of Dot
2½%	White
5%	Green
10%	Blue
15%	Yellow
20%	Red
More Than 20%	None

All prices quoted are list and are subject to the usual trade discounts. Shipments are F.O.B. our Factory. When remitting in advance, please include postage.

WE CANNOT SUPPLY SPEAKER CONES OR FIELDS SEPARATELY. WE CAN REPLACE OR REPAIR A DAMAGED SPEAKER FOR $1.25 NET, IF IT IS RETURNED TO OUR FACTORY, TRANSPORTATION CHARGES PREPAID.

PRICES SUBJECT TO CHANGE WITHOUT NOTICE.

MODELS 3035, 3037, 3065, 3067

MONTGOMERY WARD

Gang Condenser

The gang condenser is of heavy construction and all trimming condensers are aligned at the factory and set. Very seldom do they need adjustment, however, if you are positive they are out of line they may be adjusted by means of a small modulated oscillator or signal as explained on page 3 of the 2955 service manual. The trimming condensers are located directly beneath the four holes of the condenser shield. Begin by adjusting the condenser next to the tuning dial and adjust each one carefully, always making sure that your main tuning knob is adjusted to exact resonance. Align trimming condensers with the tuning dial as near 1400 kilocycles as possible. No trimming condenser adjustment is necessary for the detector stage.

Neutralizing

The screen grid tube has such a small capacity between grid and plate that no neutralizing is necessary. There is usually as much capacity between the grid and plate prongs of the tube socket and the wiring in the chassis as there is in the tube itself.

Volume Control

The volume control is wire wound and has a resistance of 8000-ohms. It is so connected as to serve a dual purpose by varying the amount of energy to the antenna input transformer and also controlling the grid bias on the three screen grid tubes. The on, off switch is also operated from the projecting stud attached to the arm of the control.

Pilot Light

The pilot is a 3.2-volt bulb, and is shown in the schematic diagram connected to the filament line supplying the heater tubes and 245s. A flickering pilot light is caused by a defective bulb, a poor socket, a loose connection in one of the leads, or by a poorly soldered joint.

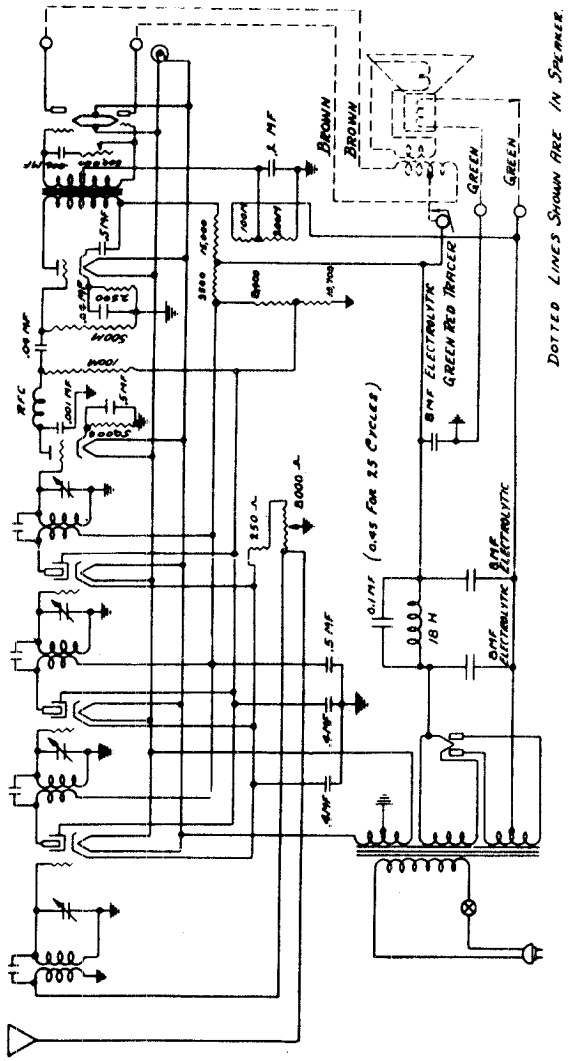
25 Cycle Chassis No. 3067 and 3037

This chassis is the same as the 60 cycle with the exception of the power transformer and the filter choke condenser. A 0.45 M.F. condenser is connected across the choke in the 25 cycle chassis, instead of the 0.1 M.F. condenser as in the 60 cycle chassis. Service instructions are the same for both.



Loud Speaker

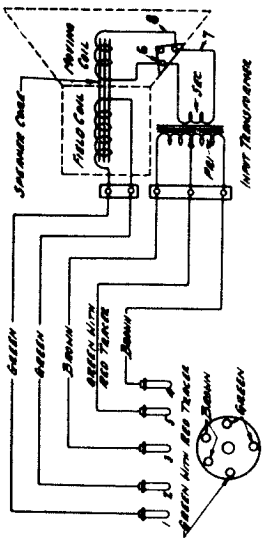


Figure 3

Fig. 3 shows the loud speaker connections and color code of wiring. The field has a resistance of 1000 ohms and is part of the filter circuit. It must therefore be connected at all times or the chassis will not operate. The speaker input transformer is mounted on the speaker chassis. The primary has a center tap connected to the positive high voltage side of the power pack and it is through this primary that the 245 tubes receive their plate supply. The secondary is a low impedance winding connecting to the voice coil of the speaker. The speaker and input transformer may be easily tested by temporarily connecting another speaker which is known to be good. Additional speakers may be used as explained on Page 7 of the instructions for the 2955 chassis, but this is not recommended.

Condenser Block

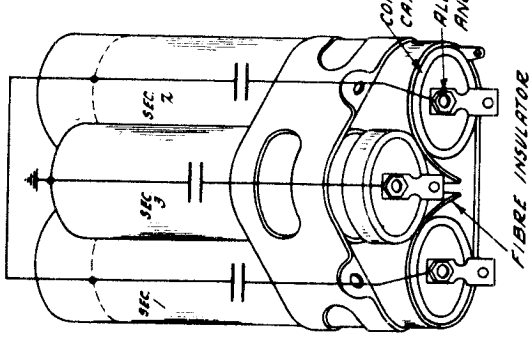

Figure 4

This is of the electrolytic type having three sections of eight M.F.D. capacity respectively. Very little trouble should be experienced with this condenser as it is self healing in case it breaks down. The connections are shown in Fig. 4.

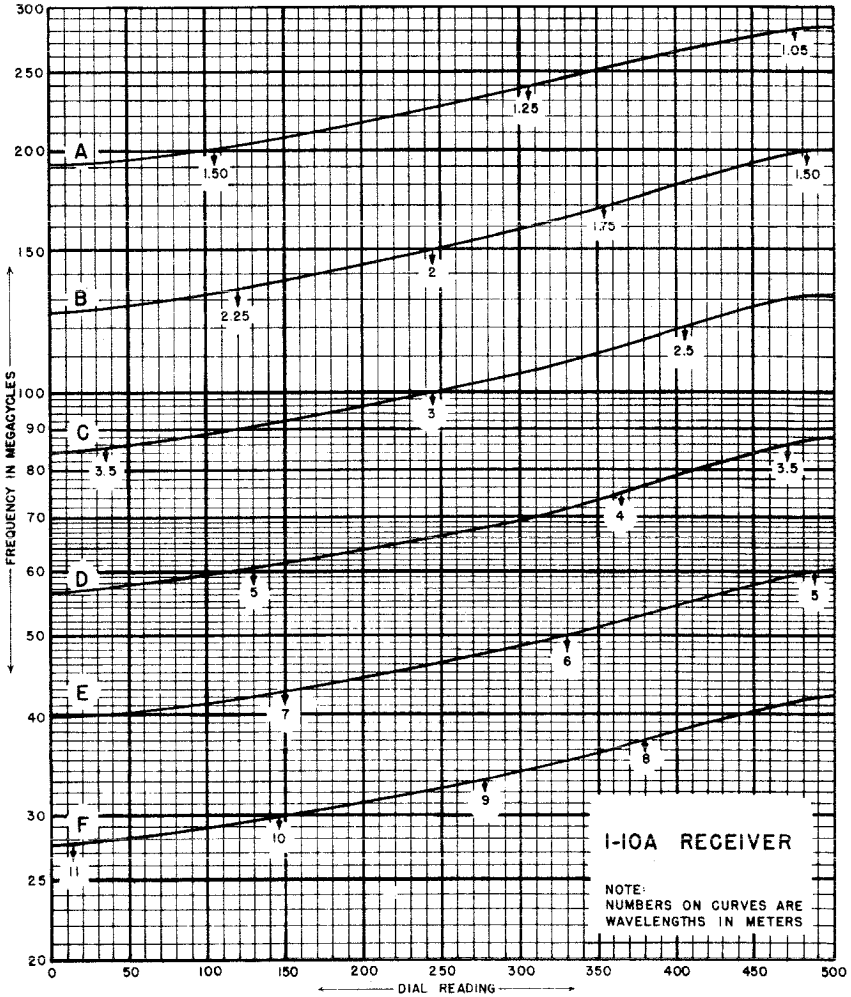
THE 1-10A RECEIVER

A complete National 1-10A communications equipment consists of the 1-10A Radio Receiver, #5886 Power Supply, and a MCS 8" PM dynamic loud-speaker with matching transformer in matching cabinets for table mounting installation.

CIRCUIT

The 1-10A Receiver employs a 4-tube circuit, consisting of one stage of tuned R.F., a self-quenching superregenerative detector, transformer coupled to a first stage of audio which, in turn, is resistance coupled to a power output stage.



DWG. NO. 2 CALIBRATION CURVES

TUNING SYSTEM

The tuning capacitors C1 and C2 plus 6 pairs of plug-in type coils are used to tune the frequency range of the receiver in six tuning bands. The frequency coverage and calibration curve of each band is shown in Dwg. 2.

The various coils are stamped "A-1", "A-2", "B-1", "B-2" etc., definitely identifying each coil. These coils are used in pairs, the letter designating the band and the number indicates the circuit position. The coil sockets of the R.F. and detector stages are marked "1" and "2", respectively, to correspond with the coil designations. The location of these coils make them readily accessible for band changing. It should be borne in mind, however, that the high frequency coils, (particularly the "A-1"), must be pushed down in the socket as far as they will go. If they are not, the inductance of the primary and secondary circuits will be increased and the calibration of the circuit will be altered.

POWER SUPPLY

The 1-10A Receiver is designed for operation from National type 5886 power unit, all voltage dividers, etc., being built in so that but one B voltage lead is necessary. The 5886 power unit is designed for operation from a 105-120 volt, 50-60 cps A.C. supply source. This power supply furnishes six volts at 1.6 amperes to the heater circuit and 180 volts at 35 milliamperes to the plate and screen circuits. A 3 volt C battery is used to supply bias to the R.F. tube. This battery is mounted in the rear right-hand corner of the R.F. compartment, being held in place by a spring clip. Two Everready type 915 cells, or equivalent, are needed. They are mounted in a bakelite tube and the positive (center) terminal of the upper cell is grounded at the top by a retaining bracket.

The 1-10A Receiver may be operated from batteries permitting portable or emergency operation. The operator is cautioned that either the loud-speaker connection or a jumper across the output terminals be maintained at all times. Failure to do this breaks the B supply to the plate of the 6V6 tube and places excessive voltage on the screen of the tube. This may result in serious damage to the tube.

If remote stand-by control is desired make a connection from the terminal on the BSW terminal panel to an external switch or relay.

BATTERY OPERATION

The 1-10A Receiver may be operated in portable or emergency service by connecting batteries to the pins of the 4 prong power plug. A 6 volt battery should be used to supply the heater circuits, (the two large prongs on the power plug), and the plate and screen circuit requirements from B batteries. To effect battery economy, the 6V6 may be removed from its socket and headphone operation used. Voltages in excess of 180 are not recommended and receiver performance will be unsatisfactory on the "A" range at voltages below 167. If lower voltages must be used, as in portable operation, resistors R1 and R3 may both be shorted out. This will allow the receiver to function normally with a maximum voltage of 90, but with reduced audio output.

In battery operation aging A and B batteries with a resultant decreasing voltage supply may render the receiver inoperative. This effect will first be noticed at the extreme ends of the "A" band.

The B supply "On/Off" Switch functions to break the positive B supply lead and in the "Off" position is useful for temporarily rendering the receiver inoperative during periods of transmission, or when changing coils, while permitting the heater circuits to remain closed. When using B battery plate supply, the switch should be thrown to the "Off" position at all times when the receiver is not in use, in order to avoid parasitic drain.

The Regeneration control functions to adjust the level at which the detector circuits go into superregeneration. This condition is indicated by a loud rushing or hissing noise. The hiss will drop down to a very low level or disappear entirely when a signal is tuned in, the reduction depending somewhat upon signal strength. Sensitivity will depend upon the adjustment of the Regeneration control, the maximum occurring just beyond the point where the hiss starts. The setting of the Regeneration control at which the detector goes into superregeneration will vary with different sets of coils and with the condition of the 955 detector tube. On the "A" range it may be necessary to advance the control to the full "On" position as the detector tube begins to wear out.

A BSW terminal panel is mounted at the rear of the receiver chassis. These terminals are connected in parallel with the B supply switch. If external (remote) stand-by control is desired, it can be accomplished by connecting a switch or relay to the terminals provided on the BSW terminal panel.

MODELS NC-2-40C,
NC-2-40CS

NATIONAL CO. INC.

1-1. *General*

The NC-2-40C RADIO RECEIVER is a twelve tube superheterodyne covering a continuous frequency range of from 490 to 30,000 kilocycles. The NC-2-40CS RADIO RECEIVER is identical with the NC-2-40C except for the frequency range covered and output terminations. The NC-2-40CS has a frequency range of from 200 to 400 and from 1,000 to 30,000 kilocycles.

Each equipment consists of a receiver and speaker built for either relay rack or table mounting and an instruction manual.

Throughout the text of this instruction manual all references to the NC-2-40C shall also apply to the NC-2-40CS except where indicated.

1-2. *Circuit*

The circuit employed on all bands consists of one stage of radio frequency amplification, a separate first detector and stabilized high frequency oscillator, two intermediate frequency stages, an infinite impedance second detector, a self-balancing phase inverter and audio amplifier, and a push-pull audio output stage.

The second detector utilizes one set of elements of a dual triode; the other set of elements is utilized for a series valve noise limiter. Separate tubes are used in the automatic volume control and beat frequency oscillator circuits. The latter is coupled to the second detector for C.W. reception.

A crystal filter is connected between the first detector and first I.F. amplifier tubes.

1-3. *Tube Complement*

The NC-2-40C is supplied complete with tubes which are tested in the receiver at the time of alignment.

1-4. *Tuning System*

The master tuning capacitor C-1 and six sets of coils are used to tune the frequency range of the receiver in six tuning bands.

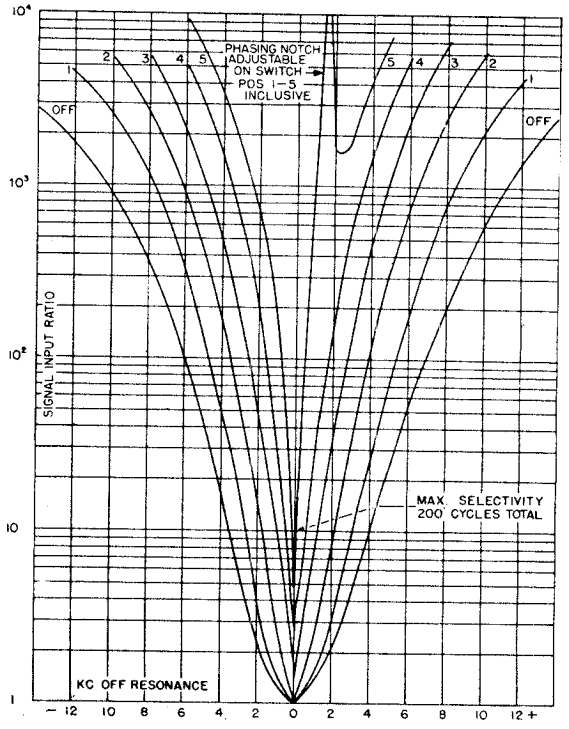
The frequency coverage of the six bands is as follows:

NC-2-40C		NC-2-40CS	
Band A	14.-30. MC	Band A	14.-30. MC
Band B	7.-14.4 MC	Band B	7.-14.4 MC
Band C	3.5-7.3 MC	Band C	3.5-7.3 MC
Band D	1.7-4. MC	Band D	1.7-4. MC
Band E	1.0-2.0 MC	Band E	1.0-2.0 MC
Band F	0.49-1. MC	Band F	200-400 KC

All transformer coils of the R.F. amplifier, first detector and H.F. oscillator stages with their associated padder and air-dielectric trimmer capacitors are mounted in a rigid aluminum casting which slides the length of the chassis, being moved by the MAIN TUNING control. The various coil assemblies are fitted with heavy contact pins which engage spring contactors mounted immediately under the variable tuning capacitor. This system permits thorough shielding of each individual coil while, at the same time, the coils in use are moved to the best position in the chassis, giving shortest leads to the tubes and master tuning capacitor, and all other coils are completely disconnected from the circuit.

1-5. *Crystal Filter*

Undoubtedly, the most efficient, flexible crystal filter yet designed is used in the NC-2-40C Receiver. Six uniform steps of selectivity, as shown in Dwg. No. 1, and a variable phasing control allow the receiver to be adjusted to almost any operating condition, a highly desirable feature for both short wave communication and broadcast band reception. The curves show that any degree of selectivity between that of full single signal operation and wide band broadcast reception is available, the ratio between the two being almost forty to one.



Dwg. No. 1. Typical Selectivity Characteristics

1-6. *Noise Limiter*

The noise limiter of the NC-2-40C Receiver is of the series valve type developed in the national laboratories. Its effectiveness and superior performance as compared to the more common types of 'silencers' were proved in the NHU and modernized NC-100 receivers. A threshold control on the front panel permits adjustment of the level at which limiting action starts.

©John F. Rider

1-7. *Tone Control*

The tone control is used to vary the frequency characteristic of the audio amplifier. The control is particularly helpful when receiving weak signals through interference, as explained in Section 3.

1-8. *Signal Strength Meter*

A 0 to 1 milliameter, serving as a signal strength meter, is front panel mounted. It is fitted with a scale in S-Units from 1 to 9 and in DB above S-9 from 0 to 40 DB. The bridge circuit, in which the meter is connected, makes possible accurate signal input readings from below 1 microvolt to 1,000 microvolts.

1-9. *Antenna Input*

Antenna input terminals are located at the rear of the receiver chassis near the center. The input circuit is suitable for use with a single wire antenna, a balanced feed-line or a low impedance concentric transmission line. Average input impedance is 500 ohms.

1-10. *Audio Output*

(1) A headphone jack is mounted on the front panel and is wired so as to silence the loud speaker when the phone plug is inserted. The correct load impedance for the headphone circuit is 20,000 ohms, this being the usual impedance of phones having a DC resistance of between 2,000 and 3,000 ohms. Maximum audio output available at the phone jack is 15 milliwatts.

(2) A five prong speaker socket (X-1) is provided at the rear of the receiver chassis. To this socket are brought the audio output leads. The proper load impedance (total) for the output circuit is 10,000 ohms. Maximum undistorted audio power output available is 8 watts.

(3) The NC-2-40CS is provided with an output transformer (T5) having a secondary with two windings which are connected to two terminal strips on the rear of the chassis. Both 8 ohm and 500 ohm terminations in addition to the speaker socket termination of 10,000 ohms are thus provided. The 8 and 500 ohm strips are the screw terminal type.

1-11. *Power Supply*

The standard NC-2-40C Receiver is designed for operation from a 110/120 volt, or 220/240 volt, 50/60 cycle power source. A toggle switch is provided in the dual primary circuit of the power transformer to permit operation from either voltage. Normal power consumption is approximately 100 volt-amps. The built-in power supply delivers all voltages required by the heater and B supply circuits-4.5 amperes at 6.3 volts and 100 milliamperes at 250 volts, respectively. One side of the AC input line is connected through a 2 ampere and a 1 ampere fuse each housed in an extractor post marked 'FUSE' which are mounted at the rear of the receiver chassis. The 2 ampere fuse is used in the circuit for 115 volt operation; both 2 and 1 ampere fuses are used for 230 volt operation.

All NC-2-40C Receivers are equipped with a seven prong plug and socket combination to permit portable or emergency operation from batteries; See Section 2-3.

1-12. *Loud Speaker*

The loud speaker supplied with the table model NC-2-40C receiver is of the permanent magnet field type having a nominal diameter of 10 inches. A coupling transformer, mounted on the loud speaker chassis, matches the voice coil to the output impedance of the receiver. A shielded three wire cable and plug is furnished for connection between the loud speaker and receiver.

1-13. *Pick-up Jack*

A pick-up jack mounted on the front panel of the receiver may be used to connect auxiliary apparatus, such as phonograph pick-up, to the audio system of the NC-2-40C Radio Receiver. This input circuit is high impedance and feeds into the 6F8G. Audio Amplifier-Phase Inverter tube. The TONE and AF GAIN controls are operative with this connection.

2-1. *Antenna Recommendations*

When using a single-wire antenna, the lead-in should be connected to one antenna input terminal and the short flexible lead, which is attached to the chassis, should be fastened to the other terminal. The dimensions of the single-wire antenna system are not critical, the recommended length, including lead-in, being from 75 to 100 feet, although any length between 25 and 200 feet may be used.

Feed-lines of doublet systems should be connected to the two input terminals. The flexible lead is not used.

The inner conductor of a concentric transmission line should be connected to one input terminal. The outer conductor and the flexible grounding lead should be connected to the other terminal.

An external ground connection to the chassis may or may not be necessary. It should be used unless it reduces signal strength.

2-2. *AC Operation*

Insert the dummy connector plug P-2 in the seven prong socket X-2.

Insert loud speaker plug P-1 in the five prong audio output socket X-1 of the Receiver.

Connect antenna feed line.

Set primary selector switch for line voltage to be used i.e. 115 or 230.

MODELS NC-2-40C
NC-2-40CS

NATIONAL CO. INC.

2-3. *Battery Operation*

The NC-2-40C may be operated in portable or emergency service by connecting batteries to the terminals of battery connector plug P-3 and inserting it in socket X-2, in place of plug P-2. See Fig. No. 1. For normal operation with somewhat reduced loud speaker output, a 6 volt heater supply (storage battery) should be connected to terminals 1 and 2 of plug P-3, and a 180 volt B supply should be connected to plug terminals 5 and 6. The jumper between terminals 3 and 4 (of P-3) completes the plate and screen supply circuits of the 6V6 output tubes. It may be omitted, with greater batterv economy, when operation with head-

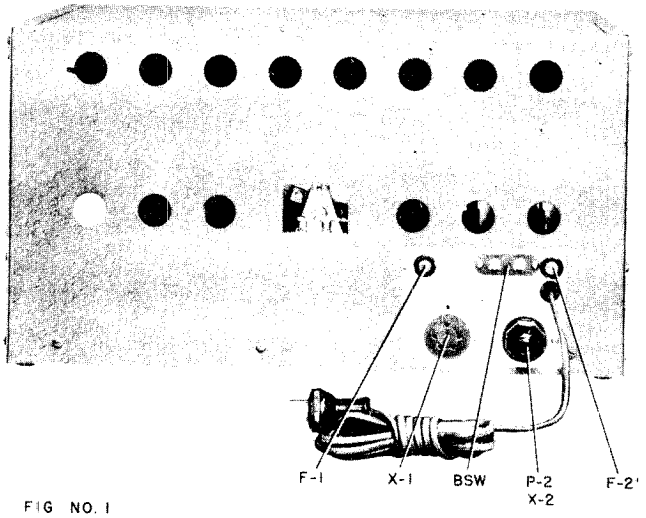

FIG NO. 1

phones only is desired. A suggested refinement is to connect a switch between terminals 3 and 4, thus permitting the 6V6 B supply to be opened at will. Alternatively, removal of speaker plug P-1 from socket X-1 will open the 6V6 B supply in the same manner, without harming the output tubes. A further economy of battery power may be effected by removing the 6V6 tubes from their sockets.

Do not attempt to use plug P-2 for battery connection, since the jumper between terminals 1 and 7 would be incorrect.

3-1. *Controls*

The MAIN TUNING control knob is located at the middle of the front panel and operates a three gang variable capacitor C-1 through approximately a 60 to 1 ratio reduction drive mechanism.

The accuracy of the calibration can be relied upon to be better than plus or minus 1%.

The tuning system of the NC-2-40C is truly single control; in fact, the MAIN TUNING control referred to above is used for band changing as well as tuning. To select any one of the six tuning bands, the MAIN TUNING control knob is pulled out about ¼ inch. When this is done, the dial and capacitor drive mechanism is disengaged and the knob is geared to the coil castings. As the knob is turned, the coil carriage is moved across the chassis until the proper coil pin contacts engage the circuit contactors, as indicated by the scale markers. Approximately one full turn of the MAIN TUNING knob is required to change from one tuning band to an adjacent tuning band. After the desired band has been selected, the tuning knob is pushed in to its original position, disengaging the coil carriage rack.

The LIMITER control, at the left-hand side of the receiver panel, is used to adjust the DC potential applied to the elements of the series valve noise limiter tube. The limiter circuit is thus provided with an adjustable threshold at which limiting starts. Any audio voltages, or peaks, in excess of this threshold are prevented from reaching the audio amplifier. With the LIMITER control set at 0, the limiter circuits will pass all but the strongest audio peak voltages; when the control is set at 10, the threshold is lowered to a point where the audio signal will be distorted due to suppression of the positive peaks.

The R.F. GAIN knob is located below and to the right of the LIMITER knob. It is used to adjust the amplification of the R.F. amplifier and two I.F. amplifier tubes. Amplification increases as the control is turned clockwise towards 9. With the knob set at 10, the meter switch is closed, connecting the signal strength meter. See Section 3-4 regarding meter use.

A CONTROL SWITCH is mounted above the R.F. GAIN control knob. In the AVC position, the automatic volume control circuits are in operation; in the MVC position, automatic volume control is turned off; in the CWO position, the beat frequency oscillator is turned on and the automatic volume control is turned off.

The POWER SUPPLY control knob is directly above the CONTROL SWITCH. In the counterclockwise position, OFF, the receiver is turned off, the primary circuit being opened by the AC line switch; in the mid-position B+ OFF, the AC line switch is turned on but the B supply circuits are incomplete since the B+ switch is opened; in the clockwise position, B+ ON, the B+ switch is closed, completing the B supply circuit. The B+ OFF position may thus be used for rendering the receiver inoperative, as may be required during transmission periods.

The PRIMARY SELECTOR SWITCH of the power transformer is mounted on the receiver chassis to the right of the power transformer. This switch selects the proper circuit arrangement of thedual primary for operation from either 115 or 230 volt power source. There is a shield provided to prevent unintentional throwing of the switch.

The A.F. GAIN control knob is located to the right of the MAIN TUNING control. It is used to adjust the audio amplification of the receiver.

©John F. Rider

Audio amplification increases as the control is turned towards 10 on the scale.

The PHASING and SELECTIVITY controls, located above the A.F. GAIN knob, are part of the crystal filter. When the SELECTIVITY control is set at OFF, the crystal is switched out of the circuit. With the crystal switched out, the phasing control has little influence on receiver performance. With the SELECTIVITY control knob set at any point between 1 and 5, inclusive, the crystal filter is in operation, selectivity increasing as the knob is advanced to 5. The PHASING control is then used to balance the crystal bridge circuit and eliminate interferring signals or heterodynes. See Sections 3-2 and 3-3.

The C.W. OSC. control knob located to the right of the SELECTIVITY control is used for varying the frequency of the beat oscillator. At 0 on the C.W. OSC. scale, the beat oscillator is tuned to the intermediate frequency. See Section 3-3.

A TONE control knob is located above the C.W. OSC. knob and is used to vary the frequency characteristic of the audio amplifier as previously described.

A BSW terminal panel is mounted at the rear of the receiver chassis. The terminals are connected in parallel with the B+ switch. If external (remote) stand-by control is desired, it can be accomplished by connecting a switch or relay to these terminals.

3-2. *Phone Reception*

After the equipment is properly installed, in accordance with Section 2, it is placed in operation by turning the POWER SUPPLY switch to B+ ON. The LIMITER control should be set at 0. The CONTROL SWITCH should be set at AVC. The PHASING knob should be set at 0; the SELECTIVITY at OFF; the TONE control should be set to give the desired audio characteristic; the R.F. GAIN control should be advanced to some point between 8 and 10, depending upon receiving conditions; the A.F. GAIN control should be set at the point providing the desired audio volume. The receiver is now adjusted for the reception of phone signals and will tune to the frequency indicated by the MAIN TUNING dial. The C.W. OSC. knob has no influence on receiver performance under these conditions.

With the CONTROL SWITCH set in the AVC position, as recommended, the R.F. GAIN knob should be advanced as far as receiving conditions permit, or until background noise becomes objectionably loud. Audio output should be adjusted entirely by means of the A.F. GAIN knob. The operator must remember that automatic volume control action will be restricted unless the R.F. GAIN knob is fully advanced.

The CONTROL SWITCH may be set at MVC, in which case the operator must be careful not to advance the R.F. GAIN knob to a point where I.F. or audio amplifier overload occurs. Such overload is indicated by distortion. In general, the A.F. GAIN control may be set at about half way on, i.e., at 5 and the audio output adjusted by means of the R.F. GAIN control.

If a signal is weak and partially obscured by background noise and static, best signal-to-noise ratio will be obtained by turning the TONE control toward the LOW position. The most effective setting must be determined by trial as too much attenuation of high audio frequencies will impair the intelligibility of speech.

When a signal is accompanied by static peaks or noise pulses of high intensity and short duration, the best signal-to-noise ratio will be obtained by advancing the LIMITER control towards 10. The best setting must be determined by trial as too much limiter action will impair audio quality. If static peaks and noise pulses are extremely strong or if they are of fairly long duration, the effectiveness of the limiter will be best with the CONTROL SWITCH in the MVC position. In such cases both R.F. GAIN and LIMITER controls must be carefully adjusted for optimum signal-to-noise ratio.

The selectivity of the receiver may be adjusted by means of the crystal filter. The normal setting of the SELECTIVITY control in phone reception is at one of the positions affording broad selectivity. Positions 1 or 2 are recommended. Selectivity may be progressively increased by turning the SELECTIVITY control to positions 3, 4 and 5 although advancing the control too far will increase selectivity to a degree where phone signals become unintelligible.

The PHASING control is used to eliminate or attenuate heterodynes. The normal setting of the PHASING control in phone reception is at 0 on the scale. If, after a signal has been tuned in, an interfering signal causes a heterodyne or whistle, the PHASING control should be adjusted until the interference is reduced to a minimum. The setting of the PHASING control which provides maximum attenuation of the heterodyne will depend upon the pitch of the heterodyne whistle. If the beat note is above 1,000 cycles, the optimum PHASING control setting will be near 0; if the beat note is 300 or 400 cycles, the optimum PHASING control setting will be near one end of the scale or the other, depending upon whether the interfering signal has a higher or lower frequency than the desired signal.

It is recommended that the TONE control be set in the HIGH position when using the crystal filter in phone reception. The resulting attenuation of low audio frequencies tends to compensate for the side-band cutting action of the crystal filter.

3-3. *C.W. Reception*

The initial adjustment of the receiver for C.W. reception is as described in Section 3-2, except that the CONTROL SWITCH must be in the C.W.O. position. The C.W. OSC. control should be set at mid-scale.

©John F. Rider

The sensitivity of the receiver should be adjusted by means of the R.F. GAIN control, care being taken not to advance the control to the point where strong signals will cause I.F. or audio amplifier overload, as indicated by excessive thumping.

The action of the TONE and LIMITER controls will be similar to that described under Section 3-2. When receiving C.W. signals, it will be possible to advance both TONE and LIMITER controls considerably further than is possible in phone reception, since audio distortion is relatively unimportant.

Turning the C.W. OSC. control will change the characteristic pitch of the receiver background noise. The pitch will become higher as the beat frequency oscillator is detuned from the I.F. amplifier. With the C.W. OSC. control set at 2 or 3 (on either side of 0), the characteristic pitch of the receiver background noise will be in the neighborhood of 2,000 cycles. Under these conditions, the audio beat note of any C.W. signal will show a broad peak at approximately 2,000 cycles. This peak will appear on 'one side of the carrier' only and the other side, where the audio beat note is around 2,000 cycles, will be considerably weaker. This characteristic, known as 'semi-single signal', is helpful in receiving weak signals through interference.

As stated in Section 3-2, the selectivity of the receiver may be adjusted by means of the crystal filter, the action of the SELECTIVITY and PHASING controls in C.W. reception being similar to that described. It is possible, however, to utilize the full range of crystal filter selectivity in C.W. reception. Maximum selectivity is obtained with the SELECTIVITY control set at 5. With this setting the single-signal effect, outlined above, becomes very pronounced; in other words, the audio beat note is very sharply peaked at a definite audio frequency which is determined by the setting of the C.W. OSC. control. The operator may have difficulty in finding the audio-peak when first attempting to use the crystal filter. After a signal has been accurately tuned to give peak response, the R.F. GAIN control may need to be retarded in order to prevent I.F. or audio overloading. With the receiver tuned to 'crystal peak', an interfering signal may be attenuated by proper setting of the PHASING knob since this control does not appreciably affect the desired signal.

3-4. *Measurement of Signal Strength*

To make a measurement of signal strength by means of the S-meter, the R.F. GAIN control must be advanced to 10, and the CONTROL SWITCH set at the AVC position. The crystal filter should be turned OFF by means of the SELECTIVITY control; the PHASING knob set at 0. The TONE, LIMITER and A.F. GAIN controls do not affect the meter reading.

Tuning the receiver to a signal will cause the meter to read, indicating the signal input in S-units or in decibels above the S-9 level.

With no R.F. input to the receiver, or with the antenna disconnected, the S-meter should read 0, plus or minus 1 S-unit. If it does not, the S-meter circuit requires adjustment. See Section 5-5.

Measurement of the signal strength of C.W. signals cannot be made with the beat frequency oscillator in operation.

4-1. *Tube Failures*

Failure of a vacuum tube in the receiver may reduce the sensitivity, produce intermittent operation, or cause the equipment to be completely inoperative. In such cases, all tubes should be checked either in an analyzer or similar tube testing equipment, or by replacement with tubes of proven qualities. All tubes should be marked as they are removed from the receiver so that they may be returned to their original sockets thereby reducing the necessity for realignment.

Individual tubes of the same type will vary slightly in their characteristics and it is well to remember this fact when replacements become necessary. Even though the circuit is designed to reduce the effect of such variations to a minimum, the high frequency oscillator and I.F. tubes should be selected with some care. A replacement high frequency oscillator should be checked in the receiver to make sure that the inter-electrode capacities are the same as those of the tube originally employed. This is easily determined by noting any change in dial calibration.

Substitution of new tubes in the I.F. amplifier may possibly alter overall gain and selectivity characteristics. Instructions for realignment are given in detail in Section 5-2.

One other point should be checked when trying the new high frequency oscillator; a fairly strong steady signal should be tuned in, preferably on some frequency above 10 mc.; the beat frequency oscillator should be turned off; jarring the receiver, or lightly tapping the tube, should not show any evidence of noise in the output.

4-2. *Circuit Failures*

Even though all component parts of the receiver have an ample factor of safety, failure may occur in individual cases. Excluding tubes, the most common failure will probably be due to some defect in a capacitor or resistor. Measurement of voltage in accordance with Section 4-4 will no doubt show where failure has occurred.

4-3. *Stage Gain Measurements*

The sensitivity measurements listed below are made with the equipment set up as specified in Section 5-1. The CONTROL SWITCH should be set at MVC, the A.F. GAIN at 10, the SELECTIVITY at OFF

©John F. Rider

and the PHASING at 0. The signal generator should be adjusted to deliver a test signal of 455 plus or minus 2 kc. either modulated or unmodulated. The high output lead should be attached to the grid of the tube specified in the table below and the ground lead connected to the receiver chassis.

With 1 milliwatt output at the phone jack, the test signal should be within the limits specified below.

Terminal	Test Signal
First Det. Grid...	50 ± 10 Microvolts
First I.F. Grid...	250 ± 50 Microvolts
Sec. I.F. Grid....	50,000 ± 10,000 Microvolts
Sec. Det. Grid....	Over 1 volt

4-1. *Voltage Tabulation*

All measurements of voltages should be made with the equipment connected for normal operation with AC supply of 115 volt, 50/60 cycle or 230 volt, 50/60 cycle. Except as noted, the R.F. GAIN knob is at 9, the LIMITER knob set at 0 and the CONTROL SWITCH knob set at MVC. A DC Voltmeter of 1,000 ohms per volt sensitivity should be used. The following table must not be considered as a list of the actual operating voltages since loading effects of the measuring instrument will disturb many of the circuits and alter normal voltage distribution. All voltages are measured between specified terminal and chassis.

The Power Output Tubes used in the NC-2-40C Radio Receiver may be the metal type 6V6 or the glass type 6V6GT/G. It is necessary, however, to provide glass type 6V6GT/G output tubes with metal shields to avoid oscillation in the audio amplifier. The recommended shield is Goat type G1222K with type G1004 connector.

5-1. *General*

All circuits are carefully aligned, before shipment, using precision crystal oscillators which insure close conformability to the dial calibration. No readjustment will be required, therefore, unless the receiver is tampered with or damaged.

To determine the necessity for realignment, the receiver should first be carefully checked against its normal performance as described in Section 3. In no case should realignment be attempted unless tests indicate that such realignment is necessary.

The coil group which is plugged into the circuit at any time is the one directly underneath the three gang master tuning capacitor. The coil nearest the front panel of the receiver is in the H.F. oscillator circuit, the middle coil is in the first detector circuit and the coil nearest the antenna input terminal panel is in the R.F. amplifier circuit. See Fig. No. 5.

All coils have individual trimmer capacitors. The H.F. oscillator circuits of tuning bands E & F

have, also, variable series padding capacitors. These capacitors are identified in Fig. No. 5.

A screwdriver having a metal shaft may be used to make adjustments in the high frequency circuits but capacity effects will be noticeable, and the shaft should not touch any part of the aluminum casting.

Before proceeding with the alignment of any circuit of the receiver, the equipment must be set up as specified in Section 2, except that the antenna lead-in or transmission line must be disconnected. An output meter having a 20,000 ohm resistor load should be connected to the phone output jack. The POWER SUPPLY knob should be set at B+ ON and the R.F. GAIN knob set at 9. The TONE control knob should be set at N and the LIMITER knob should be retarded to 0.

Alignment of the equipment may be divided into two major steps:

(1) I.F. Amplifier Alignment
(2) H.F. Circuits Alignment
  (a) H.F. Oscillator
  (b) First Detector and R.F. Amplifier
  (c) Tracking of H.F. Circuits

The circuits MUST be tuned in the above order when complete alignment is necessary.

5-2. *I.F. Amplifier Alignment*

The intermediate frequency of the NC-2-40C Receiver is 455 kilocycles, plus or minus 2 kilocycles. The exact frequency is determined by the quartz crystal resonator Y-1.

Tuning capacitors are provided on the crystal filter and on each I.F. transformer. These capacitors are designated by symbol numbers C-39 and C-41 to C-46, inclusive on Fig. Nos. 3 and 4.

The high output lead of an accurately calibrated signal generator should be connected to the grid terminal of the first detector tube and the grounded lead to any convenient point on the chassis. The flexible lead need not be disconnected from the grid of the tube. Connection is made directly from the output jack of the signal generator, the dummy antenna being omitted. The CONTROL SWITCH of the receiver should be in the CWO position and the modulation of the signal generator turned off to provide a steady C.W. test signal. The PHASING control of the receiver should be set at 0 and the SELECTIVITY control at 5. The A.F. GAIN control should be fully advanced.

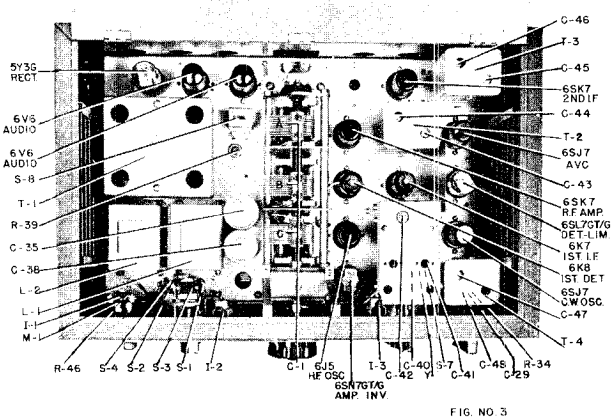

FIG. NO. 3

Adjust the output attenuator of the signal generator to provide a signal of approximately 100 microvolts and vary the tuning control of the signal generator slowly between the frequencies of 453 and 457 kilocycles. At some frequency between these limits the I.F. amplifier of the receiver will show a very sharply peaked response, as indicated on the output meter. The output attenuator of the signal generator should be retarded after the signal generator has been tuned to the I.F. peak in order to avoid I.F. or audio overload; the C.W. OSC. control must be set to provide an audio beat note in the middle of the audio range (between 400 and 1,000 cycles).

The I.F. tuning capacitors C-39 and C-43 to C-46, inclusive, should each be carefully adjusted to give a maximum reading on the output meter. The order in which the adjustments are made is not important. While making I.F. amplifier adjustments, it will be necessary to retard the attenuator of the signal generator if the readjustment increases I.F. amplifier gain to the point where overload occurs.

The crystal filter SELECTIVITY knob should then be set at 1 and the signal generator detuned between 3 and 4 kilocycles either side of the crystal frequency. Capacitor C-42 should be tuned for maximum output meter reading. After this adjustment is made, the SELECTIVITY knob should be set at OFF and the signal generator retuned to exact crystal frequency. Compensator capacitor C-41 should then be adjusted for maximum reading on the output meter.

The performance of the I.F. amplifier and audio circuits may be checked against the stage gain data in Section 4-3 after alignment has been completed. Selectivity may be checked sgainst the curves of Dwg. No. 1.

After alignment of the I.F. amplifier has been completed, the C.W. OSC. control should be set at 0 at which setting the C.W. oscillator should be at zero beat with the test signal. If zero beat does not occur at zero, readjust capacitor C-47 of transformer T-4, as shown in Fig. No. 3.

The quartz crystal resonator Y-1 may be checked at the conclusion of I.F. amplifier alignment as follows: the SELECTIVITY control should be set at 5 and the signal generator tuned to the crystal frequency. The output meter reading should be noted. When the SELECTIVITY knob is turned to OFF, the meter reading should decrease 1 to 2 db. provided the PHASING knob is at 0. An

NATIONAL CO. INC.

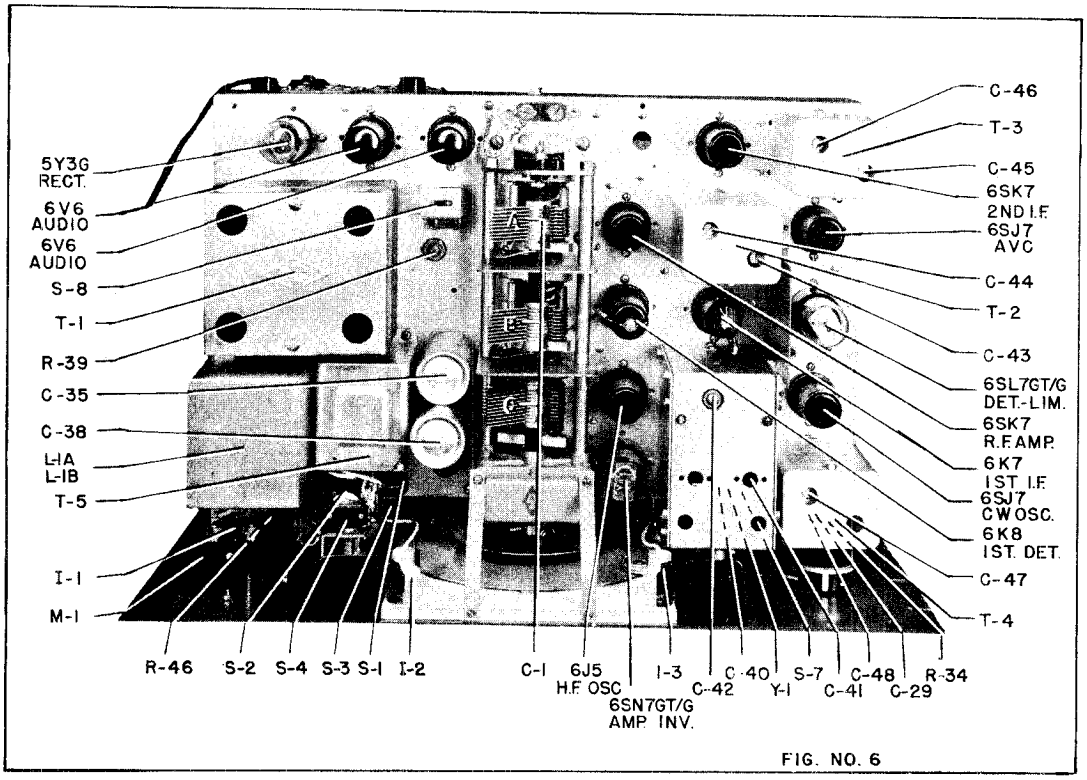

FIG. NO. 6

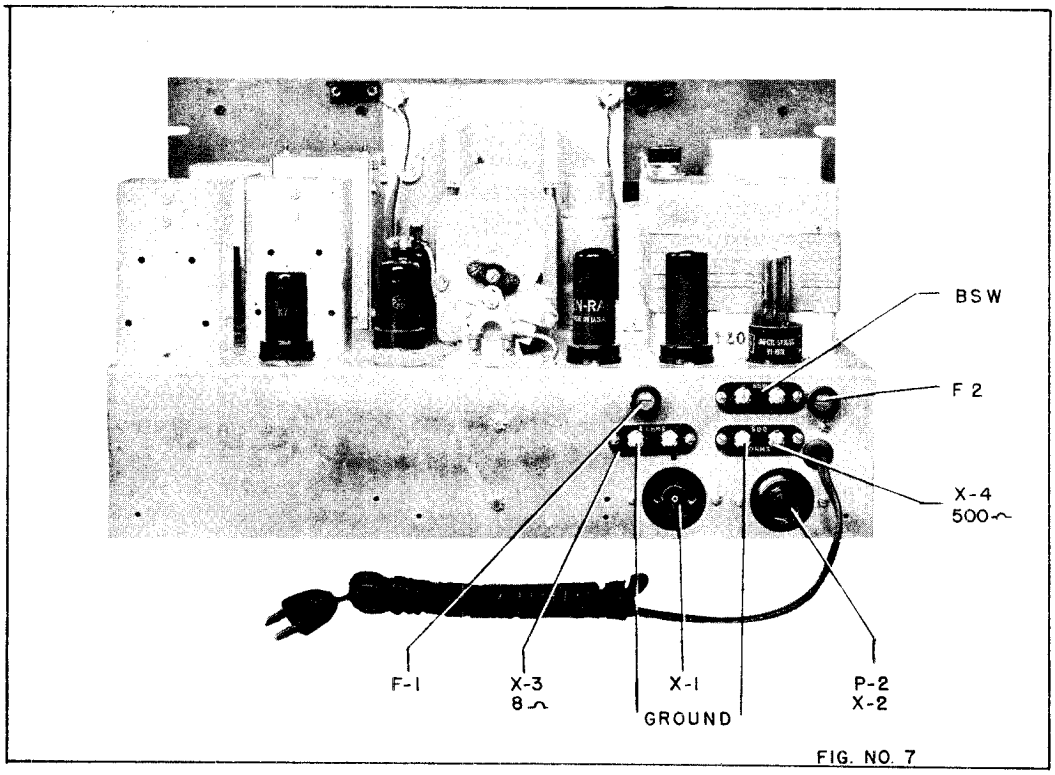

FIG. NO. 7

Top and rear views of NC-2-40CS receiver

©John F. Rider

increase in meter reading can, in most cases, be traced to an improper adjustment in the I.F. amplifier, since the crystal resonator is mounted in a sealed holder, and it is rather unlikely that trouble will be had from that source.

5-3. *General Coverage Alignment*

(a) H.F. oscillator

Alignment is effected as follows: with the coil range to be aligned connected in the circuit and with the receiver controls set as recommended in Section 5-1, the MAIN TUNING dial should be set near the high frequency end of the range. A signal generator should be connected to the antenna input terminal through a standard IRE dummy antenna and accurately tuned to deliver a signal of the same frequency as that indicated by the receiver dial setting. If, when this signal is tuned in, the dial reading is too high, the capacity of the H.F. oscillator trimmer C-52 should be decreased to make corrections. Conversely, low dial readings are corrected by increasing the capacity of trimmer C-52.

It is imperative that the high frequency oscillator circuits operate at a higher frequency than that of the first detector and R.F. amplifier circuits. This can be checked by tuning in the image signal, which should appear at a dial reading approximately 910 kilocycles below that of the real signal. The image signal should be considerably weaker if the R.F. amplifier is correctly aligned and a stronger test signal may be required before the image can be found. If the image does not appear at the lower frequency dial setting, the H.F. oscillator circuit is incorrectly adjusted and the capacity of the H.F. oscillator trimmer capacitor in question must be decreased until the real signal and image signal appear at the proper points on the dial.

(b) First Detector and R.F. Amplifier

With the signal generator adjusted to deliver a modulated signal near the high frequency limit of the band to be checked, the receiver should be tuned to give maximum output, as indicated by the output meter. The first detector and R.F. amplifier trimmer capacitors C-51 and C-50, respectively, should then be varied until the output meter reads maximum. On the highest frequency bands, adjustment of the first detector and R.F. amplifier trimmers may change the calibration of the high frequency oscillator, necessitating retuning of the MAIN TUNING dial. If these trimmers should require considerable realignment, it may be necessary to readjust the high frequency oscillator trimmer C-52 in order to maintain correct calibration.

A very simple and quick method of first detector and R.F. trimmer alignment may be used if a signal generator is not available. This method consists of setting the trimmers at the adjustment which provides maximum circuit or background noise. It will be found that trimmer settings under this method are sufficiently sharp to provide good alignment, although the adjustment must be made with care to avoid alignment to the image frequency.

(c) Tracking of H.F. Circuits

After the H.F. oscillator, first detector and R.F. amplifier trimmers have been properly set at the high frequency limit of the band, the receiver should be tuned to a frequency toward the low frequency end. Tracking at any point up to the low frequency limit may be checked by adjusting the signal generator to the proper frequency and testing the settings of the first detector and R.F. amplifier trimmers for maximum gain. Calibration may be checked also at these points. After such a test, all trimmers checked should be reset at the high frequency end of the band since their settings are most critical at this point.

Errors in tracking near the low frequency limits of the band can be caused by defects in any of three circuit elements.

(1) The tuning capacitor section.
(2) The circuit inductance.
(3) The H.F. oscillator series padding capacitor.

In order to determine if one or more sections of the master tuning capacitor C-1 are the cause of any mistracking present, it is necessary to make the check described above on two or more different bands. If the same tracking error appears on all bands, the master tuning capacitor is definitely at fault. The error should be corrected by permanently bending the rotor or stator plates to provide the proper capacity.

If the tracking error appears only in the R.F. amplifier or first detector stage of only one band, the inductance of the tuned circuit of the stage is incorrect. Should the tracking checks indicate that the H.F. oscillator circuit of a particular band is at fault, either the inductance of the circuit, the series padding capacitor or both may be responsible.

After any change or readjustment is made to any high frequency circuit inductance or series padding capacity, it will be necessary to relign the associated trimmer at the high frequency limit of the coil range. Tracking should then be rechecked.

5-4. *S-Meter Adjustment*

The S-meter balancing resistor R-39, shown in Fig. No. 3, is used to obtain zero meter reading in the absence of signal input to the receiver. The adjustment is as follows: Set the R.F. GAIN control at 10, CONTROL SWITCH at MVC, and disconnect the antenna leads; adjust R-39 until the S-meter reads zero.

MODELS NC-2-40C,
NC-2-40CS

NATIONAL CO. INC.

5-5. *Band Indicator Adjustment*

An adjustment for centering the band indicator markers in the horizontal slots of the dial face is located in back of the MAIN TUNING knob. It is recommended that the MAIN TUNING knob be pulled out to engage the band changing mechanism, and turned clockwise to the last position before the stop. The red band marker should then indicate the 14-30mc. tuning band. To make the adjustment, simply remove the tuning knob and set the ¼" hex-head screw as may be required. The screw is self-locking.

It is often found necessary in various communication services to provide a means for feeding the output of the receiver into a standard 500 ohm telephone transmission line at a 6 milliwatt or ODB level. Also means for monitoring the receiver and the telephone circuit may be required. The NC-2-40CS can be readily provided with a voltage divider and monitor circuit to fulfill these requirements. A suitable divider will consist of a 5000 ohm, 2 watt resistor connected in series with 500 ohm, 1 watt resistor across the 500 ohm termination of T5 (see X-4 in Fig. 7). In addition to the divider, the output circuit must be terminated at all times, either by use of a properly matched loud-speaker or a suitable load resistor. A loud-speaker or load resistor may be connected to any-one of the three output circuits, but the voltage divider mentioned above must be connected to the 500 ohm output circuit.

Drawing number 3 shows a possible circuit arrangement using a 500 ohm loud-speaker or a 500 ohm, 10 watt load resistor as the receiver load. The switch functions merely to silence the loud-speaker when required. If either a 10,000 ohm loud-speaker or an 8 ohm speaker is used no additional 500 ohm load is required across the 500 ohm receiver output circuit. Headphone monitoring connections should be made to the 500 ohm telephone line as shown because plugging the head-phones into the receiver phone jack disables the speaker output circuits. A high impedance headset is recommended for use across the 500 ohm telephone line. The total attenuation of the voltage divider is approximately 20 decibels. The power supplied to the 500 ohm telephone line corresponding to maximum receiver output is approximately 20 milliwatts.

Note No. 1. Capacitor rating is different in each coil range and is individually adjusted as circuit conditions may require. Definite rating cannot be listed. C53 used in E and F bands only. C54 used in A,B,C and D bands only.

Note No. 2. Resistors R8 and R11 may have values between 300 and 5,000 ohms since they are chosen to meet the circuit requirements of the particular receiver. The resistance values are determined after careful laboratory tests and cannot be changed without impairing performance.

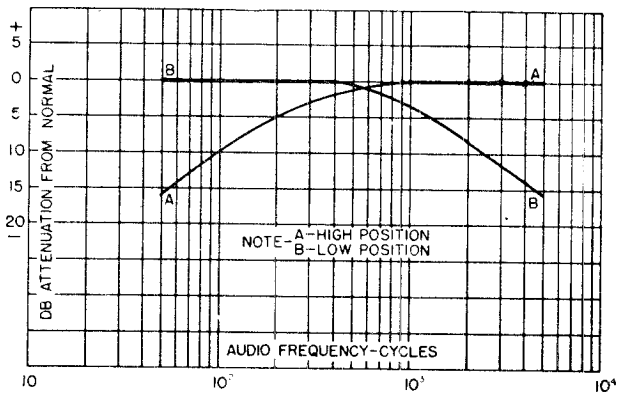
Fig. No. 4. B-3 Coil--Typical H.F. Oscillator Bandspread Coil



Dwg. No. 2. Tone Control Action

©John F. Rider

NATIONAL CO. INC.

The circuit description, installation, operation, service and test data, and alignment data sections applying to Models NC-2-40C and NC-2-40CS (see page numbers below), also apply to Model NC-2-40D, with the exceptions of the following sections:

1-4. *Tuning System*

The master tuning capacitor C-1 and six sets of coils are used to tune the 490 to 30,000 kilocycle range of the receiver. By means of a highly developed band change mechanism, four of these same coil sets are made to spread the 10, 20, 40 and 80 meter amateur bands uniformly over the major portion of the tuning dial (HRO System). All ten ranges are calibrated

1-6. *Noise Limiter*

The noise limiter of the NC-2-40D Receiver is of the series valve type developed in the National Laboratories. Its effectiveness and superior performance as compared to the more common types of "silencers" were proved in the NHU and modernized NC-200 receivers. A threshold control on the front panel permits adjustment of the level at which limiting action starts.

1-7. *Tone Control*

The tone control is used to vary the frequency characteristic of the audio amplifier as shown in the accompanying curves, Dwg. No. 2. The control is particularly helpful when receiving weak signals through interference, as explained in Section 3.

1-13 *Pick-up Jack*

A pick-up jack mounted on the front panel of the receiver may be used to connect auxiliary apparatus, such as a phonograph pick-up, to the audio system of the NC-2-40D Radio Receiver. This input circuit is high impedance and feeds into the 6SN7GT/G Audio Amplifier-Phase Inverter tube. The TONE and A.F. GAIN controls are operative with this connection.

3-1. *Controls*

The tuning system of the NC-2-40D is truly single control; in fact, the MAIN TUNING control referred to above is used for band changing as well as tuning. To select either a general coverage or bandspread coil range, the MAIN TUNING control knob is pulled out about 1/4 inch. When this is done, the dial and capacitor drive mechanism is disengaged and the knob is geared to the coil casting. As the knob is turned, the coil carriage is moved across the chassis until the proper coil pin contacts engage the circuit contactors, as indicated by the scale markers. Approximately one full turn of the MAIN TUNING knob is required to change from one general coverage range to an adjacent general coverage range. Approximately one-quarter turn of the knob is required to shift from a general coverage range to the associated bandspread range near the high frequency end. The knob does not turn smoothly between ranges, but only a few minutes is required to become familiar with its action. After the desired range has been selected, the tuning knob is pushed in to its original position, engaging the capacitor drive and disengaging the coil carriage rack.

5-1. *General*

All coils have individual general coverage trimmer capacitors. The H.F. oscillator circuits of broadcast ranges E & F have, also, general coverage variable series padding capacitors. All coils of ranges A, B, C and D have band-spread trimmer capacitors. Variable series padding capacitors are used in all H.F. oscillator band-spread circuits. These capacitors are identified on Fig. No. 6.

Adjustment of general coverage circuits affects the alignment of the band-spread circuits. On the other hand, band-spread circuit adjustments have little effect on general coverage circuit alignment. This fact must be kept in mind when any high frequency circuit is adjusted.

Alignment of the equipment may be divided into three major steps:

(1) I.F. Amplifier Alignment
(2) General Coverage Alignment
  (a) H.F. Oscillator
  (b) First Detector and R.F. Amplifier
  (c) Tracking of H.F. Circuits
(3) Band Spread Alignment
  (a) H.F. Oscillator
  (b) First Detector and R.F. Amplifier
  (c) Tracking of H.F. Circuits

The circuits MUST be tuned in the above order when complete alignment is necessary.

5-4. *Band-Spread Alignment*

(a) H.F. Oscillator

The method of adjusting the H.F. oscillator band-spread trimmer C-57 of any band is the same as that described under Section 5-3 (a) above. As stated previously (Section 5-1), the adjustment of the general

©John F. Rider

NATIONAL CO. INC.

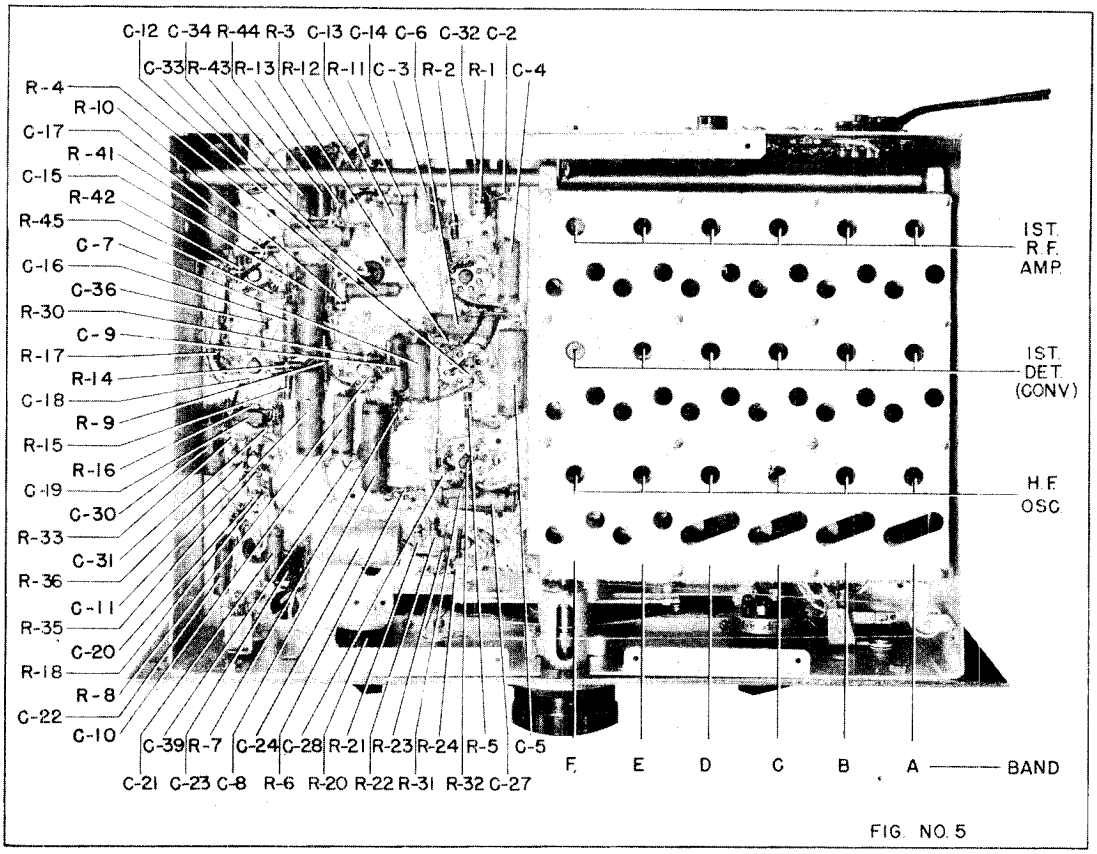


FIG. NO. 5

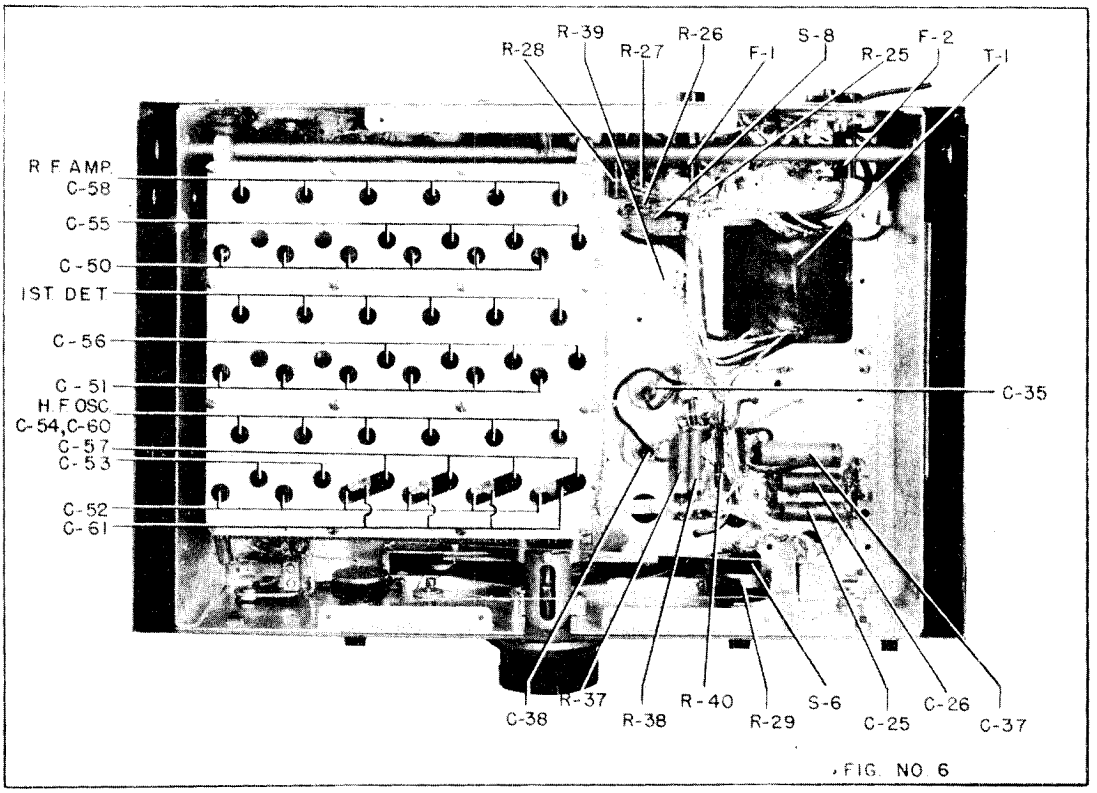

FIG. NO. 6

©John F. Rider

Band-spread Alignment (cont'd)

coverage trimmers must not be altered at this time.

(b) First Detector and R.F. Amplifier

The method of adjusting the band-spread trimmers C-59 and C-58 of the first detector and R.F. Amplifier circuits is the same as that described under Section 5-3 (b).

(c) Tracking of H.F. Circuits

After steps (a) and (b) have been completed, the MAIN TUNING control should be turned to the low frequency band limit, and the accuracy of the dial reading checked. If the dial reading is too low, the capacity of the series padding capacitor C-61 (See Fig. No. 6) should be increased until the dial reading is correct, and vice versa. The MAIN TUNING control should then be reset at the high frequency band limit, and step (a) repeated. Recheck the low frequency dial reading and repeat the whole procedure if necessary.

The detector and R.F. amplifier stages have fixed band-spread padding capacitors. These circuits will, therefore, track properly with the H.F. oscillator stage provided that the general coverage circuits are properly aligned and that the band-spread H.F. oscillator circuits are accurately tuned.

5-5. *S-Meter Adjustment*

The S-meter balancing resistor R-39, shown in Fig. No. 3, is used to obtain zero meter reading in the absence of signal input to the receiver. The adjustment is as follows: Set the R.F. GAIN control at 10, CONTROL SWITCH at MVC, and disconnect the antenna leads; adjust R-39 until the S-meter reads zero.

5-6. *Band Indicator Adjustment*

An adjustment for centering the band indicator markers in the horizontal slots of the dial face is located in back of the MAIN TUNING knob. It is recommended that the MAIN TUNING knob be pulled out to engage the band changing mechanism, and turned clockwise to the last position before the stop. The red band marker should then indicate 28 to 30 mc. (10 meter) band-spread. To make the adjustment, simply remove the tuning knob and set the 1/4" hex-head screw as may be required. The screw is self-locking.

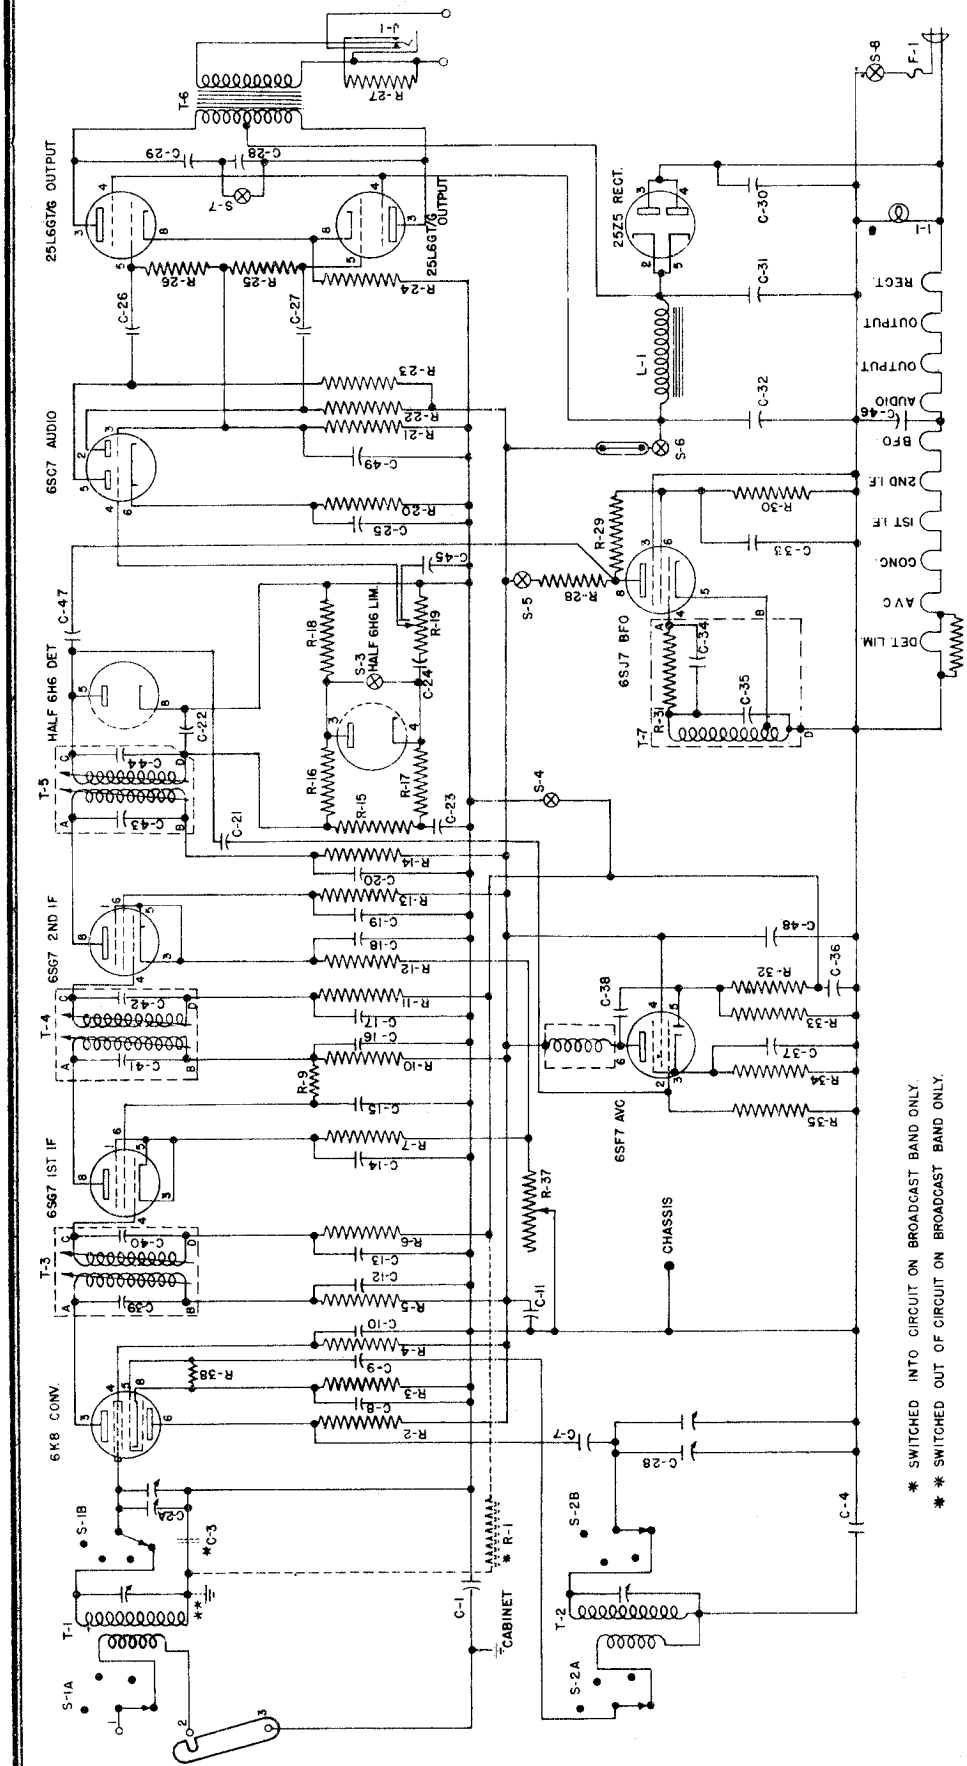
Note No. 2. Resistors R8 and R11 may have values between 300 and 5000 Ohms since they are chosen to meet the circuit requirements of the particular receiver. The resistance values are determined after careful laboratory test and cannot be changed without impairing performance.

* These Capacitors used on the A band only.

NATIONAL CO. INC.



NC-46 RECEIVER
DWG. NO. I-SCHEMATIC DIAGRAM

IF PEAK 455 KC

The master tuning capacitor C2 and four sets of associated coils are used to tune the frequency range of the receiver in four tuning bands for both general coverage and bandspread operation.

The overall frequency coverage of the four bands is as follows:

Band A	11.5 -	30 0 MC
Band B	4.4 -	12.0 MC
Band C	1.55 -	4.6 MC
Rand D	0.54 -	1.6 MC

The following bands in the short wave ranges are tunable by the bandspread capacitor and are spread as follows:

3.5 -	4.0 MC	65 Divisions
7.0 -	7.3 MC	50 Divisions
14.0 -	14.4 MC	56 Divisions
28.0 -	30.0 MC	40 Divisions

FIG. NO. 1

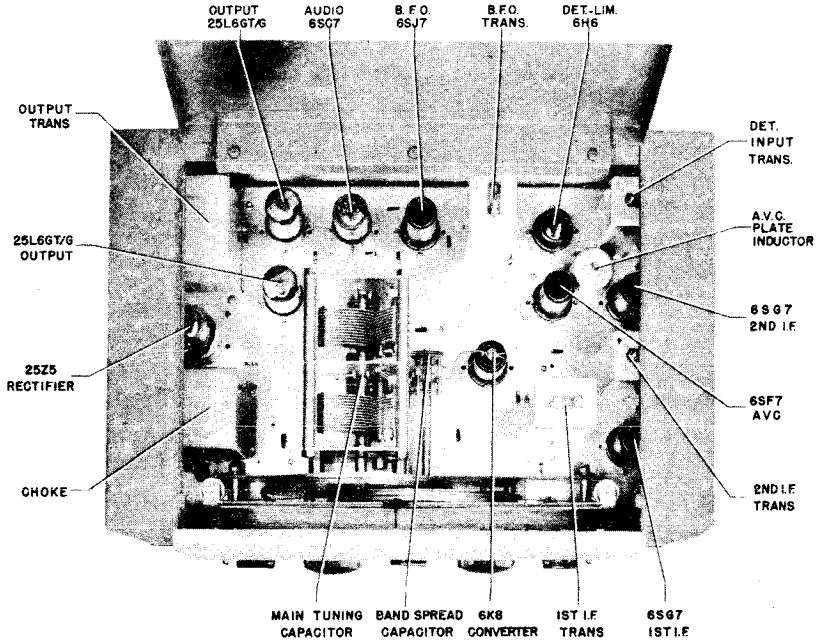

FIG. NO. 3

Circuit

The circuit employed in the NC-46 consists of a converter stage, two intermediate frequency stages, diode detector, limiter, beat frequency oscillator, AVC amplifier, phase inverter, push-pull output and rectifier stages.

The second detector utilizes one set of elements of a dual diode; the other set of elements is used for a noise limiter. Separate tubes are used in the automatic volume control and beat frequency oscillator circuits. The latter is coupled to the second detector for C.W. reception.

All voltages required by the receiver circuits are supplied by a built-in power supply.

Audio Output

Two audio output circuits are provided:

(1) A headphone jack is mounted on the rear of the receiver and is so wired as to silence the loudspeaker when the phone plug is inserted. The load impedance for the headphone output is not critical and any good set of headphones may be used.

(2) Tip-jack terminals are provided at the rear of the receiver for speaker connection. The output load impedance of the receiver is 10 ohms. This allows the use of a permanent magnet speaker with a voice coil of 8 to 10 ohms. The use of a matching output transformer is not required. Maximum undistorted audio power output available is approximately 4 watts.

©John F. Rider

Antenna Recommendations

There is an antenna terminal strip mounted at the rear of the receiver with three screw-type connections available marked #1, #2 and #3. Terminal #3 is the ground connection. The strip is furnished with a sliding link to short out terminals #2 and #3 for operation with a single wire antenna. Doublet antennae, directive arrays etc., having two wire feeder systems may be used connecting directly to terminals #1 and #2, terminal #3 and strap not being used. For general coverage a single wire antenna of approximately 50 to 100 feet will be found to give satisfactory results. To obtain peak performance on any particular desired channel the antenna length should be approximately an odd quarter-wave length of the band in use.

Controls

The MAIN TUNING control knob is located to the left of the center of the front panel. This knob operates a two gang variable capacitor through a 30 to 1 ratio reduction drive mechanism.

The ELECTRICAL BANDSPREAD control knob is located to the right of the center of the front panel. This knob operates a separate two gang variable capacitor to provide bandspread tuning.

The BAND SELECTOR switch is located at the center of the front panel and functions to select the tuning-band desired. The band in use is indicated by the designating letters on this switch dial. The four tuning scales on the main tuning dial are marked at either end of the dial by these designating letters.

Tuning is accomplished by the following steps:

(a) Select the band to be used by means of the BAND SELECTOR switch.

(b) The frequency calibration of the main tuning dial will only be correct with the bandspread pointer set at 90. After this setting has been made the MAIN TUNING control knob is used to tune in the desired station. The bandspread pointer may then be used to give greater accuracy in logging.

The TONE CONTROL switch is located at the upper left-hand side of the receiver and functions to select the frequency characteristic of the audio amplifier as desired, i.e. HIGH or LOW. The HIGH position will give the better fidelity and the LOW a better signal to noise ratio.

The C.W.O. CONTROL switch is located to the right of the TONE CONTROL switch functioning to switch on or off the beat frequency oscillator.

The VOLUME control is located to the left of the MAIN TUNING knob functioning to adjust the audio amplification of the receiver. Part of this control is a stand-by switch permitting the A.C. line switch to remain on but with B supply circuit open.

The LIMITER CONTROL switch is located at the upper right-hand side of the front panel functioning to switch "On" or "Off" the noise limiter. This control is normally in the "Off" position

The A.V.C. CONTROL switch is located to the left of the LIMITER switch functioning to switch the automatic volume control circuits into or out of the receiver circuits.

The SENSITIVITY control is located to the right of the BANDSPREAD control knob and functions to adjust the amplification of the two I.F. amplifier tubes. Incorporated in this control is the power supply "ON" "OFF" switch; with this switch in the "Off" position the receiver is inoperative.

There is a B.S.W. terminal panel provided at the rear of the receiver to permit remote stand-by control. The terminals are connected in series with the B switch.

After the equipment is properly installed, it is placed in operation by turning the SENSITIVITY control to 10 and the VOLUME control to the point which provides the desired audio volume. The TONE control should be "On"; the C.W.O. control should be "Off"; the A.V.C. control should be "On"; the LIMITER should be "Off". The receiver is now adjusted for the reception of phone signals and can be tuned to the desired frequency and band by means of the MAIN TUNING control and BAND SELECTOR switch.

Individual tubes of the same type are apt to vary slightly in their characteristics and it is well to remember this fact when replacements become necessary. The circuit of the receiver has been designed to reduce the effect of such variations to a minimum but care should be taken in replacing the converter and I.F. amplifier tubes. A replacement converter tube should be checked in the receiver to make sure that the inter-electrode capacities are the same as those of the tube originally employed. This is readily checked by noting any change in the calibration at the high end of any tuning band. This change should not exceed two or three dial division.

Power Supply

The NC-46 Receiver is designed for operation from a 110/130 volt, A.C. or D.C. power source. Normal power consumption is approximately 65 watts. All voltages required for the heater and B supply circuits are delivered by a built-in power supply.

One side of the input power line is connected through a 2 ampere fuse to prevent any possible damage to the receiver due to a short-circuit or ground. This fuse is housed in an extractor post mounted at the rear of the receiver which permits ease in removal or inspection of the fuse.

MODEL NC-46

NATIONAL CO. INC.

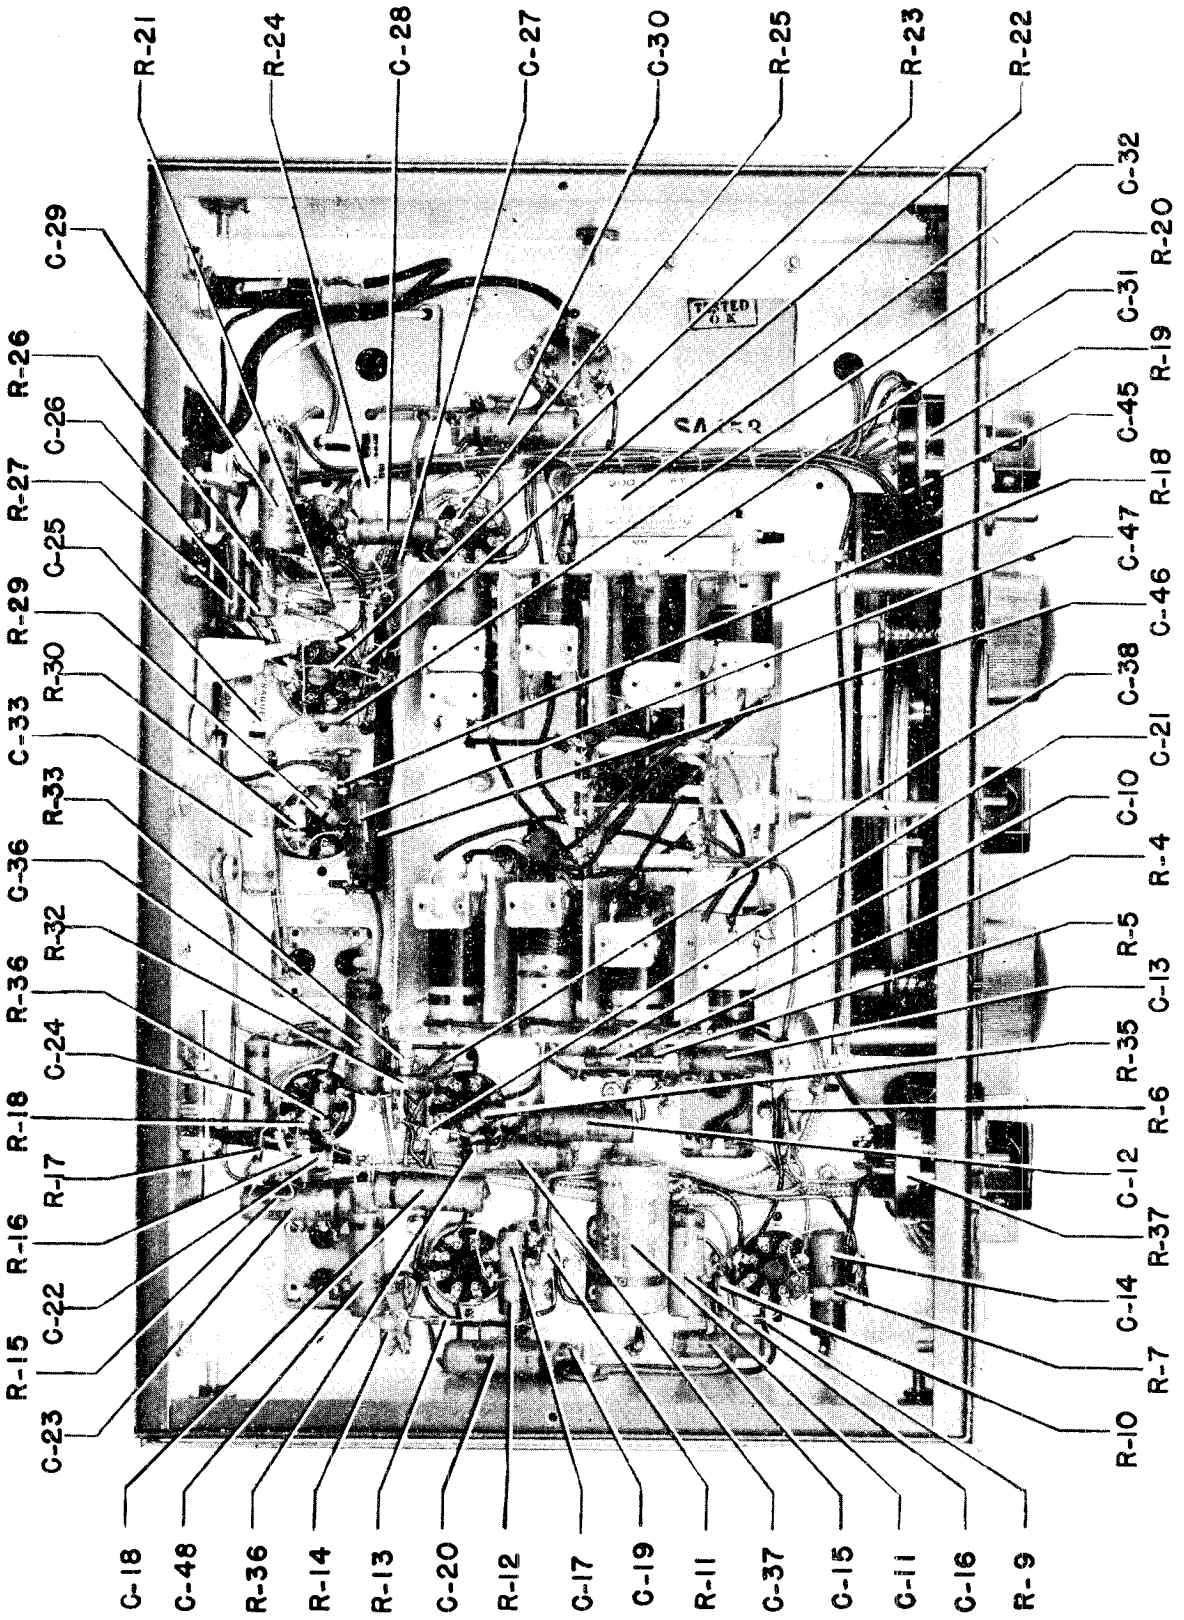

FIG. NO. 4

©John F. Rider

NATIONAL CO. INC.

The coil groups are mounted in a cadmium plated steel compartment which is directly below the main two gang variable capacitor. The oscillator coils are mounted nearest the left-hand side of the receiver with the first detector coils at the right. All coils have individual trimmer capacitors.

I.F. Amplifier Alignment

The intermediate frequency of the NC-46 Receiver is 455 kilocycles. The three I.F. transformers are of the permeability tuned iron-core type with primary and secondary adjustments.

The first I.F. transformer adjustments, the primary of the second I.F. transformer and the secondary of the third I.F. transformer adjustments are made from inside the cabinet; the secondary of the second I.F. transformer and the primary of the third I.F. transformer adjustments are made through holes in the top of the cabinet. These holes are concealed by means of sliding buttons.

To properly align the receiver the equipment should be set up as specified except that the antenna be disconnected and the A.V.C. switch turned to "Off", the VOLUME control turned to 10 and the TONE control be switched "Off" An output meter having a 10 ohm resistive load should be connected to speaker output terminals. The high output lead of an accurately calibrated signal generator should be connected to the grid terminal of the converter tube and the grounded lead to any convenient point on the chassis. Adjust the output attenuator of the signal generator to provide a signal of approximately 100 microvolts and vary the tuning control of the signal generator slowly between the frequencies of 452 and 458 kilocycles. At some frequency between these points the I.F. amplifier of the receiver will show a sharply peaked response as indicated on the output meter. The I.F. tuned iron cores should be carefully adjusted to give a maximum reading on the output meter. The order in which these adjustments are made is not important.

Coil Alignment

Controls should be set as outlined Alignment is effected as follows:

a. H.F. Oscillator alignment

(1) Set the MAIN TUNING dial to some frequency at the high end of the tuning band to be aligned.

(2) Connect a signal generator, accurately tuned to deliver a signal of the same frequency as that indicated by the receiver dial setting, to the antenna input terminals through a standard 500 ohm dummy antenna.

(3) By checking the calibration of the receiver against the signal delivered by the signal generator, the accuracy of the H.F. oscillator alignment can be observed. If the dial reading of the receiver is found to be high it can be corrected by decreasing the capacity of the H.F. oscillator trimmer capacitor; conversely, low dial readings can be corrected by increasing the capacity of the trimmer.

(4) Care should be taken to insure that the H.F. oscillator is tuned to the fundamental frequency and not the image. This can be checked by tuning to the image frequency which should appear 910 kilocycles below the fundamental frequency and should be considerably weaker. If the operator finds the receiver is tuned to the image signal the capacity of the H.F. oscillator trimmer capacitor should be decreased until the fundamental frequency appears at the proper dial setting.

b. 1st Detector alignment.

(1) With the signal generator adjusted to deliver a modulated signal near the high frequency limit of the tuning band to be checked, the receiver should be tuned to give maximum output, as indicated by the output meter. The 1st detector trimmer capacitor should then be adjusted to give a maximum reading on the output meter. If this trimmer requires considerable realignment it may necessitate the realignment of the H.F. oscillator trimmer to maintain correct calibration.

(2) An alternate method of aligning the 1st detector in the event a signal generator is not available is to set the trimmers at the setting giving the maximum background noise. It will be found that this method gives a sufficiently sharp indication to provide good alignment.

*Because of the many variables that may enter into voltage measurements it is impractical to indicate ABSOLUTE values of voltage. Readings must necessarily be AVERAGE voltages and even these are subject to a ±10% variation.

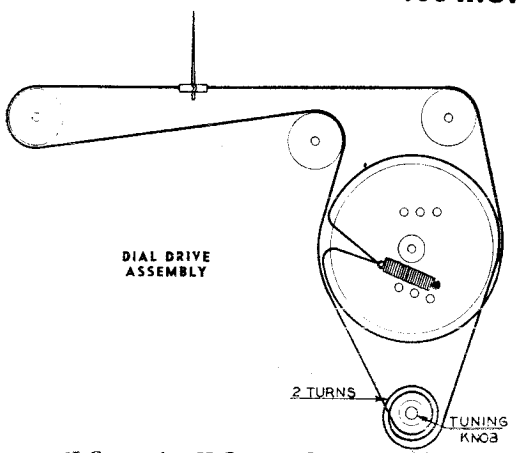
D.C. measurements shown are at 20,000Ω/volt.

A.C. measurements shown are at 1,000Ω/volt.

Readings are taken from SOCKET PINS TO COMMON NEGATIVE while viewing socket from the BOTTOM.

Volume Control set at MINIMUM.

Tuning Condenser set at Full Mesh (Maximum Capacity)



SERVICE NOTES

HUM MODULATION:

On Early Production runs Condenser C-18 consisted of two — .05 mfd. units. One ground terminal was connected to CHASSIS, the other to B—. Disconnect the CHASSIS terminal of the .05 Condenser now connected to Pin No. 1 of the NU-12SA7GT tube and connect this lead to Pin No. 5 of either of the NU-12SK7GTs or to any other convenient B— point. This effectively by-passes the A.C. Modulation hum to B— instead of to Chassis.

OSCILLATION:

Remove one side of Resistor R-2 (in grid circuit of 12SA7GT) now connected to A.V.C. bus and reconnect to cathode (#5 pin) of I.F.—12SK7GT.

TUNING Broadcast Band — 535 K.C. to 1620 K.C. — 2 Gang Variable Capacitor

POWER SUPPLY 105-125 Volts, 60 cycles A.C. — 105-125 Volts, Direct Current — Approx. 30 Watts Consumption

CIRCUIT CHANGES.

The following changes have been made in Chassis RE-200 since the start of production.

1. Connections to pins 2 & 7 have been interchanged on 12SA7 tube.
2. A 15 ohm resistor, R-11 has been added in B+ lead at Cathode of 35Z5GT tube.
3. .005 Condenser C-5 and 150 ohm Resistor R-3 have been deleted from oscillator circuit.
4. Tap has been added to Primary of IF transformer T-3 and trimmer connected directly across primary winding.

PRELIMINARY.

ALIGNMENT PROCEDURE

Output meter connection ..... Across loudspeaker voice coil
Output meter reading to indicate 200 milliwatts (standard output) ..... 0.8 volts
Dummy antenna to be in series with signal generator output ..... See chart below
Connection of generator ground lead ..... Floating ground
Generator modulation ..... 30% 400 cycles
Position of Volume Control ..... Fully clockwise
Position of pointer with vzriable fully closed ..... 54 on dial

Position of Variable	Generator Frequency	Dummy Antenna	Generator Output Connection	Trimmers Adjusted	Trimmer Function	Approximate Sensitivity
Open	455 Kc	.05 uf	12SA7 Grid (Stator of C-1)	2 trimmers on top of T-3	IF	3000 uv
1400 Kc	1400 Kc	.00005 uf	Antenna lead	**C-2	Oscillator	360 uv

**Since the antenna section of the variable has no trimmer, the rotor of the variable should be rocked back and forth on both sides of 1400 Kc while adjusting the oscillator trimmer for maximum output. This is to obtain the combination of rotor and trimmer setting to give perfect tracking of the two sections of the variable condenser and consequently give maximum output.

Check sensitivity at 600 Kc. If weak, adjust antenna section plates for maximum output at 600 Kc. Tracking of the condenser at points other than 1400 Kc is accomplished by bending the outside plates on the variable condenser rotor, which are cut for this purpose. When bending plates to track the condenser at any given frequency, keep in mind the fact that this will effect the tracking at all frequencies below that point. A tuning wand is very helpful in checking the tracking of this condenser, to indicate whether more or less capacity is needed.

The alignment procedure should be repeated stage by stage in the original order for greatest accuracy.

Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

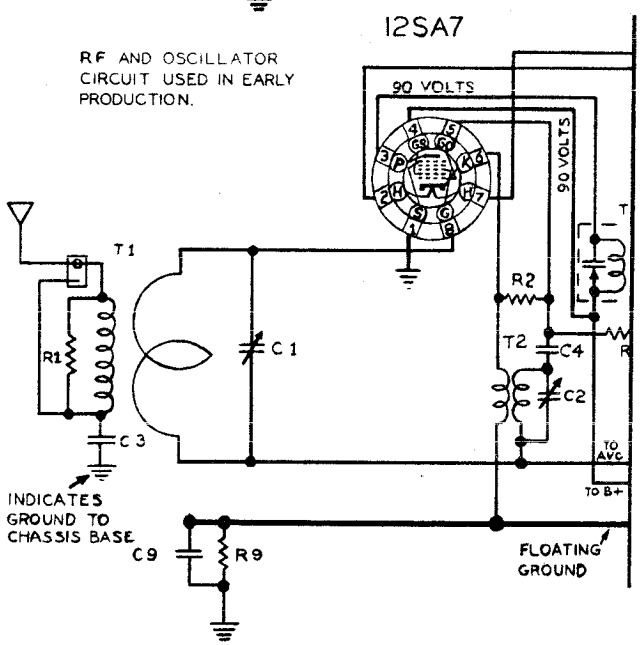
RF AND OSCILLATOR CIRCUIT USED IN EARLY PRODUCTION.



TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO FLOATING GROUND AND ARE TAKEN WITH NO SIGNAL. A C LINE VOLTAGE AT 117 VOLTS. WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ.

1946

SERVICE HINTS AND CIRCUIT CHANGES.

Sets made previously to March, 1946 had the Variable Condenser rotors connected to the AVC line instead of being grounded to chassis base, and did not have the .1 ufd condenser C-11 connected from the AVC line to chassis base. (In a few sets this is a .05 ufd condenser C-9)

On the early sets, if the dial pointer, shaft, or metal pulley on variable is allowed to touch the dial scale, or plate, the rotor of variable will be grounded, causing noise and distortion. The circuit was changed to eliminate this condition.

If distortion or a chopped output signal is encountered in this set, try replacing the 50L6 tube.

OUTLINE FOR TUBE LAYOUT

* ON SETS MADE PREVIOUS TO MAY 1946 THE 12SA7 TUBE WAS LOCATED BETWEEN THE VARIABLE CONDENSER AND 1ST I.F. TRANSFORMER

PRELIMINARY.

Output meter connection ..... Across loudspeaker voice coil
Output meter reading to indicate 200 milliwatts (standard output)..... .8 volts
Dummy antenna value to be used in series with generator output ..... See chart below
Connection of generator output lead ..... See chart below
Connection of generator ground lead ..... *Floating ground
Generator modulation ..... 30% 400 cycles
Position of Volume Control ..... Fully clockwise
Position of dial pointer with variable fully closed ..... Horizontal
Place the set loop in the same position with respect to the rear of the chassis, and the same distance from the chassis, as it would be with the set mounted in the cabinet.

Position of Variable	Frequency of Generator	Dummy Antenna	Generator Output Connection	Trimmers adjusted in Order Shown for Max. Output	Function of Trimmer
Open	455	.01 mfd.	12SA7 Grid (Stator of front section of variable condenser)	Top of 2nd & 1st IF Trans.	IF
1400	1400	.00005 mfd.	Antenna Clip (With blue wire removed)	C2; C1, trimmers on Rear & Front sections of Variable Condenser	Osc. Ant.
600	600	.00005 mfd.	Antenna Clip (With blue wire removed)	**Adj. antenna section plates of variable cond. for Max. output.	Antenna

If a standard test loop is used with the signal generator for alignment of the receiver, the blue wire will be left in the antenna clip, and the approximate sensitivities should be 300 uv/m and 250 uv/m or less at 600 Kc and 1400 Kc respectively.

Approximate stage by stage sensitivities for 200 Milliwatt output.

IF. - 455 Kc. -------- 3350 uv
Mixer 455 Kc. -------- 75 uv
Mixer 1000 Kc.-------- 60 uv
Antenna 1000 Kc -------- 50 uv
Antenna 1400 Kc -------- 25 uv
Antenna 600 Kc -------- 50 uv

The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the AVC action of the receiver ineffective.

*A floating ground connection can be obtained on either of the lugs on the back of the AC switch or the black lead on the Volume Control.

**AS THE CONDENSERS ARE ALL TRACKED BEFORE LEAVING THE FACTORY IT IS NOT PROBABLE THAT THE PLATES WILL NEED TO BE ADJUSTED UNLESS WIDE VARIATIONS IN TUBES ARE ENCOUNTERED.

The outside plates on the antenna section of the variable condenser are cut, so they can be bent in or out to give more or less capacity at any given position of the rotor, after the trimmers on the variable have been adjusted at 1400 Kc. A disc type tuning wand affords a quick method of determining whether more or less capacity is needed in the antenna circuit. If the output increases when the Iron end of the wand is placed near the loop, the plates should be bent in to give more capacity. If the output increases when the brass or aluminum end of the wand is placed near the loop the plates should be spread out. If the wand indicates

cont'd on next page

©John F. Rider

NOBLITT-SPARKS INDUSTRIES INC.

that the plates should go closer, but cannot go closer without shorting, the oscillator section plates can be spread, but the calibration should be checked after adjusting the oscillator section. Also the band coverage should be checked to see that 540 Kc can be received.

If the receiver is weak at 1000 Kc the same procedure can be followed at 1000 Kc as outlined above for 600 Kc but this will change the tracking at 600 Kc and may affect 1400 Kc so that all points should be rechecked in the original order.

The condenser should be checked for any possible shorting of the plates after the alignment is completed.

POWER SUPPLY

105-125 Volts AC-DC, 35 Watts

POWER OUTPUT

Undistorted	.8 Watts
Maximum	2.5 Watts
Plate load	2000 ohms

Due to variations in tubes some sets which are equipped with 12SK7GT tubes may have a tendency to oscillate. This condition can usually be corrected by placing a shield on the 12SK7GT tube or replacing it with a 12SK7 metal tube. In some cases the IF transformers may need to be repeaked after changing this tube.

Several cases of weak sets have been caused by a defective 12SA7GT tube which will check good on the average tube tester. Alignment should be checked after changing this tube.

ALIGNMENT PROCEDURE

PRELIMINARY.

Output meter connection ..... Across loudspeaker voice coil
Output meter reading to indicate 200 milliwatts (standard output) ..... .8 volts
Dummy antenna value to be used in series with generator output ..... See chart below
Connection of generator output lead ..... See chart below
Connection of generator ground lead ..... Floating ground
Generator modulation ..... 30% 400 cycles
Position of Volume Control ..... Fully clockwise
Position of dial pointer with variable fully closed ..... Vertical

Place the set loop in the same position with respect to the rear of the chassis, and the same distance from the chassis, as it would be with the set mounted in the cabinet. This distance is 1 3/16" from the plate on back of chassis to back of the loop. If the position of the loop is not correct while adjustments are made on the antenna circuit, the antenna circuit will not track and the set will be weak, when placed in the cabinet.

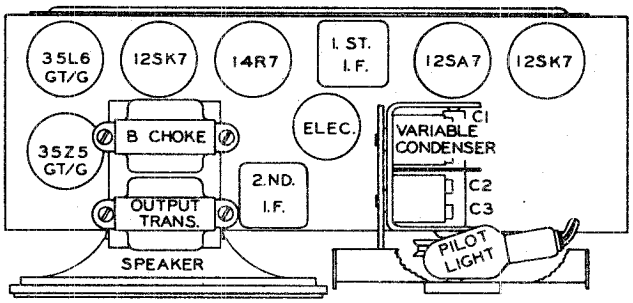
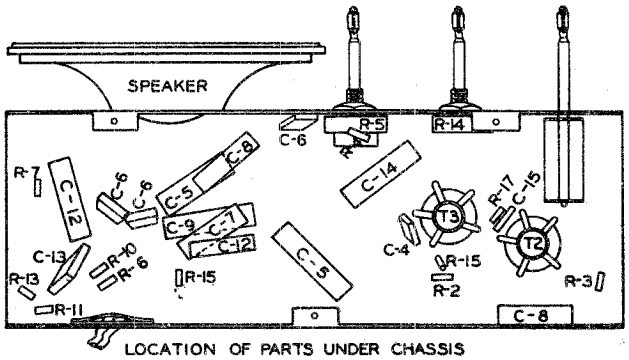
Chassis RE-206

NOBLITT-SPARKS INDUSTRIES INC.



TUBE LAYOUT



LOCATION OF PARTS UNDER CHASSIS

Position of Variable	Frequency of Generator	Dummy Antenna	Generator Output Connection	Trimmers adjusted in Order Shown for Max. Output	Function of Trimmer.
Open	455	.01 mfd.	12SA7 Grid or (Stator of center section of variable condenser)	Top of 2nd & 1st IF Trans.	IF
1400	1400	.00005 mfd.	Antenna Clip (With black wire removed)	*C3; C2; C1, trimmers on Variable Condenser	Osc. RF Ant.
600	600	.00005 mfd.	Antenna Clip (With black wire removed)	**Adj. plates of variable cond. for Max. output.	Osc. RF Ant.

If a standard test loop is used with the signal generator for alignment of the receiver, the black wire will be left in the antenna clip, and the approximate sensitivities should be 250 uv/m and 150 uv/m or less at 600 Kc and 1400 Kc respectively. Sets using glass 12SA7 tube may have slightly weaker sensitivities.

Approximate stage by stage sensitivities for 200 Milliwatt output.

IF. - 455 Kc. --------	10,000 uv	Antenna 1000 Kc --------	15 uv
Mixer 455 Kc. --------	150 uv	Antenna 1400 Kc --------	15 uv
Mixer 1000 Kc. --------	170 uv	Antenna 600 Kc --------	25 uv

The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the AVC action of the receiver ineffective.

*Trimmer C3 (oscillator) is located either on the top or bottom of the variable condenser, depending on the type variable used on any particular set.

**AS THE CONDENSERS ARE ALL TRACKED BEFORE LEAVING THE FACTORY IT IS NOT PROBABLE THAT THE PLATES WILL NEED TO BE ADJUSTED UNLESS WIDE VARIABIONS IN TUBES ARE ENCOUNTERED OR THE CONDENSER HAS BEEN DAMAGED. PLATE BENDING SHOULD NOT BE ATTEMPTED WITHOUT THE PROPER EQUIPMENT, OR BY ANYONE NOT EXPERIENCED AT TRACKING CONDENSERS.

The outside plates on the antenna & RF sections of the variable condenser are cut, so they can be bent in or out to give more or less capacity at any given position of the rotor, after the trimmers on the variable have been adjusted at 1400 Kc. A disc type tuning wand affords a quick method of determining whether more or less capacity is needed in the antenna circuit. If the output increases when the Iron end of the wand is placed near the loop, the plates should be bent in to give more capacity. If the output increases when the brass or aluminum end of the wand is placed near the loop the plates should be spread out. If the wand indicates that the plates should go closer, but cannot go closer without shorting, the oscillator section plates can be spread, or vice versa, but the calibration should be checked after adjusting the oscillator section. Also the band coverage should be checked to see that 540 Kc can be received.

Since the osc. section has much less capacity than the RF & antenna sections, plate bending will be much more effective in the osc. circuit, and a small change in or out in the plates of this section will have the same effect as a large change in the opposite direction in the other sections.

If the receiver is weak at 1000 Kc the same procedure can be followed at 1000 Kc as outlined above for 600 Kc but this will change the tracking at 600 Kc and may affect 1400 Kc so that all points should be rechecked in the original order.

The condenser should be checked for any possible shorting of the plates after the alignment is completed.

SERVICE HINTS AND CIRCUIT CHANGES.

If the dial pointer is allowed to touch the dial scale, the rotor of the variable condenser, which is connected to the AVC Line, will be grounded, causing noise & distortion.

If the set has a tendency to be microphonic, check the rubber grommets on the Variable Condenser mounting, if these are hard replace them with soft rubber grommets.

C15 (14 mmf. cond.) was added to RF Circuit and R17 was changed from 3300 ohms to 6800 ohms, after start of production.

MODEL 558, Early, Late, Ch. RE-204

NOBLITT-SPARKS INDUSTRIES INC.

If a set is found to be microphonic when playing records, check for the presence of 4 felt washers under the chassis and a wood block $3\frac{3}{4}$" x 8" x $\frac{3}{4}$" mounted under the phono-motor board, in front of the center brace. If these are not present, installing them should correct the microphonic condition. The block should be glued to the under side of the motor board against the front side of the center brace, with two $\frac{3}{4}$" wood screws driven from the top side of the motor board into the block, to draw it up tight. Place the screws so the heads will be under the turntable.

POSITION OF POWER CORD PLUG.

On AC, the power cord plug should be tried in both its possible positions in the receptacle, and left in the position that gives least hum. Do not attempt to operate on DC.

MODEL T5TS1
MODEL T5TS3

NORTHEASTERN ENGINEERING INC.
Model T5TS1 Broadcast Receiver

GENERAL DESCRIPTION

The Model T5TS1 **ELECTONE** is a five tube superheterodyne broadcast entertainment receiver designed for operation from either a direct or alternating current power source. The circuit utilizes multi-unit tubes and incorporates automatic volume control. The chassis is enclosed in an all-metal cabinet of modern styling and having the following dimensions: Width 12"; Depth 7"; Height 7".

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts, 50-60 cycles, AC or 105-125 volts DC
Power Consumption	30 watts
Frequency Range	500-1700 Kcs.
Intermediate Frequency	456 Kcs.
Audio Output	1.5 watts

TUBE COMPLEMENT

Converter and Oscillator	12SA7
I.F. Amplifier	12SK7
Detector-AVC-Audio	12SQ7
Power Output	50L6GT
Rectifier	35Z5GT
Dial Lamp	Mazda #6S6

LOUDSPEAKER

Permanent Magnet.....5" Diameter

INSTALLATION FACILITIES PROVIDED

Power	5' cord and plug
Antenna	10' indoor type
Ground	None required

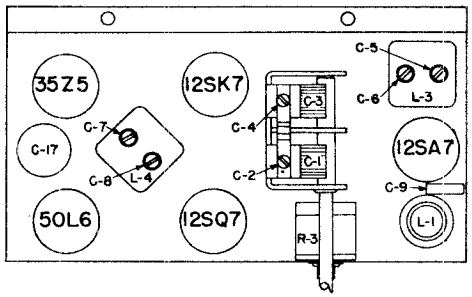

FIG. 1 - Tube and Trimmer Locations (Top View)

ALIGNMENT PROCEDURE

Alignment Frequencies:

I.F.	456 Kcs.
R.F.	1500 Kcs.

I. F. Alignment:

Connect output meter across the voice coil. Turn the receiver volume control to maximum. Connect high side of the alignment oscillator, through a .05 mfd. capacitor, to the converter grid.

Set alignment oscillator at 456 Kcs. and adjust output to give the lowest conveniently readable indication on the output meter. Adjust trimmers C-7 and C-8 in 2nd I.F. transformer to give maximum indication on output meter. Repeat this procedure for trimmers C-5 and C-6 in the 1st I.F. transformer. Repeat procedure to check accuracy.

R. F. Alignment:

Retain output meter connected as above and receiver volume control set at maximum. Connect alignment oscillator to antenna.

Set alignment oscillator at 1500 Kcs. and place in operation. Rotate receiver tuning capacitor (C-1 and C-3) to give maximum signal indication on output meter. Adjust output of alignment oscillator to give the lowest conveniently readable indication on the output meter. Adjust oscillator trimmer C-4 to peak the signal indication on output meter. Then, adjust antenna trimmer C-2 to further peak the signal. Repeat procedure to check accuracy.

Trimmer locations are shown in Figure 1.

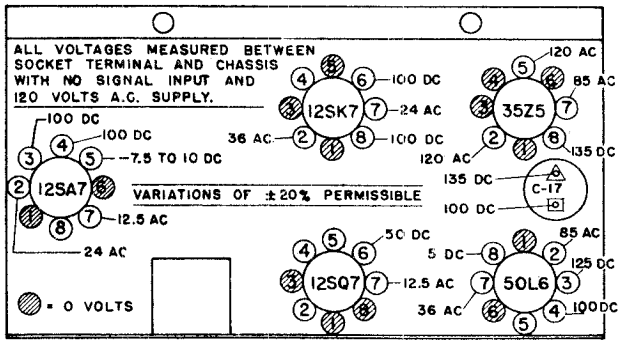

FIG. 2 - Socket Terminal Voltages (Bottom View)

NOTES:

An electronic voltmeter may be connected to the AVC bus and used for alignment indication in lieu of the output meter across the voice coil.

An electronic voltmeter or a voltmeter with a minimum resistance of 20,000 ohms per volt should be used for voltage measurements.

The polarity of the power connection must be correct when operating the receiver on direct current. If the receiver does not operate when the power plug is first inserted, remove and re-insert in opposite position. Reversal of plug position on alternating current supply may reduce hum in some cases.

CAUTION:

A direct ground connection should not be placed on the receiver at any time. Particular care should be exercised when removing and replacing chassis to insure that the insulators between chassis and cabinet are in position and that the insulation is complete and effective.

MODEL 982375

OLDSMOBILE DIV.-GENERAL MOTORS

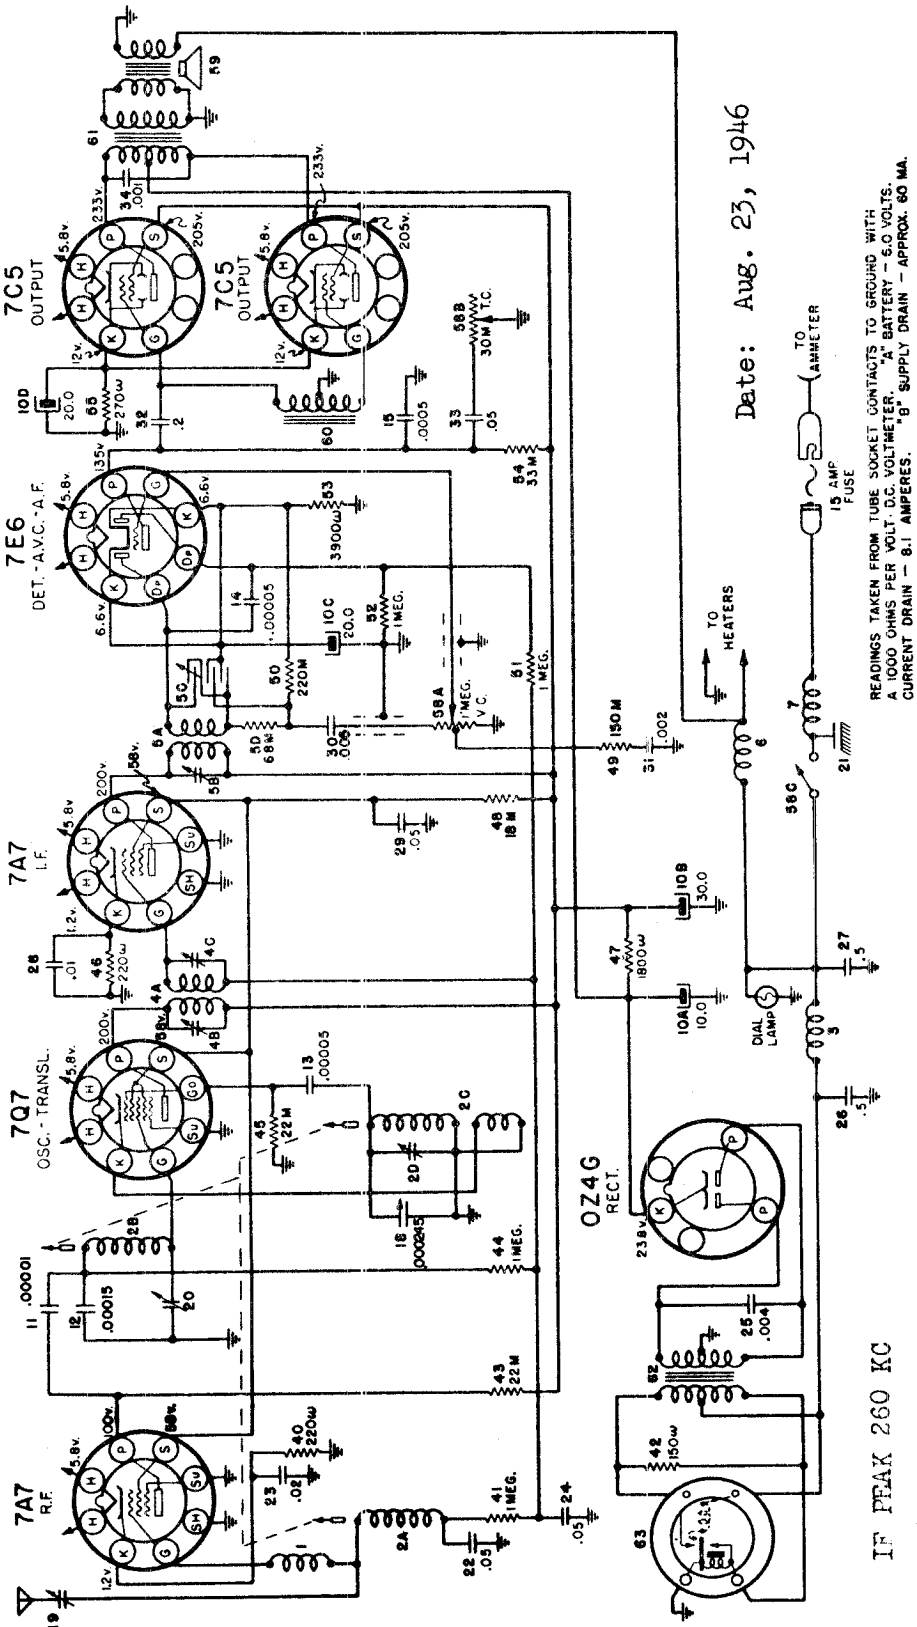

Fig. 3 - Circuit Diagram - 982375

The Oldsmobile model 982375 is a single unit DeLuxe Receiver with Automatic Push Button Tuning, in addition to Manual Tuning, Volume and Tone Controls.

The receiver was designed specifically for the 1946 Oldsmobiles. The push Button Assembly, Controls, Receiver and Speaker are built into a housing which is mounted directly behind the center of the instrument panel.

OLDSMOBILE DIV.-GENERAL MOTORS

CIRCUIT ALIGNMENT

All of the adjustable condensers in this receiver are very accurately adjusted at the factory and will need no further adjustment (excepting antenna trimmer) unless tampered with or a defective coil has been replaced. If re-alignment is found to be necessary, the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and an output meter.

DO NOT ATTEMPT TO PEAK THE I-F STAGES OF THIS RECEIVER WITHOUT CAREFULLY NOTING THE FOLLOWING INSTRUCTIONS:

1. Aligning I-F Stages at 260 Kilocycles

   (a) Turn volume control to the maximum position.

   (b) Connect the signal lead of the test oscillator through a .1 mfd. condenser to terminal X (See Parts Layout), which is the grid prong of the 7Q7 tube.

   (c) Connect the ground lead of the test oscillator to the chassis frame.

   (d) Connect the output meter across the speaker voice coil at the terminal board mounted on the speaker. Connect between point "Z" and ground. This terminal is color coded green on strip. (See Parts Layout)

   (e) Set the test oscillator to exactly 260 Kilocycles.

   (f) Adjust the trimmers "A", "B", "C" and "D" on the I-F Transformers for maximum output. (See Parts Layout) The adjustments should be repeated several times and during alignment the test oscillator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.

2. Aligning at 1610 Kilocycles

   (a) Remove the signal lead of the test oscillator from the grid of the 7Q7 tube and connect to the Antenna terminal of the receiver THROUGH a .00065 mfd. MICA CONDENSER connected in place of the .1 mfd. condenser previously used. (It is very important that a .00065 mfd. mica condenser be used when aligning the antenna stage of these receivers in order that this circuit can be made to track properly.)

   (b) Tune the receiver to the extreme high frequency end of the dial.

   (c) Set the test oscillator to 1610 Kilocycles.

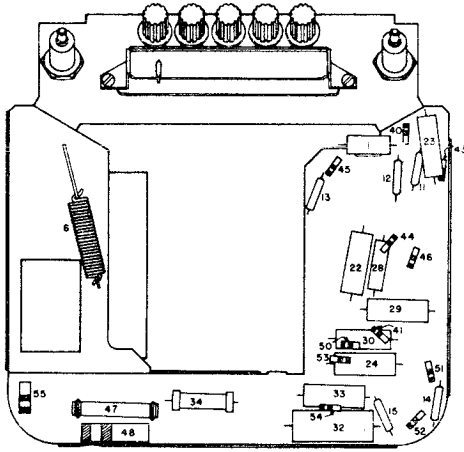
   (d) Adjust the Oscillator Trimmer Condenser "E" for maximum output. (See Parts Layout) (It is very important that this frequency be set accurately as a slight mis-setting will cause the receiver to be out of track over the high frequency end of the dial.)

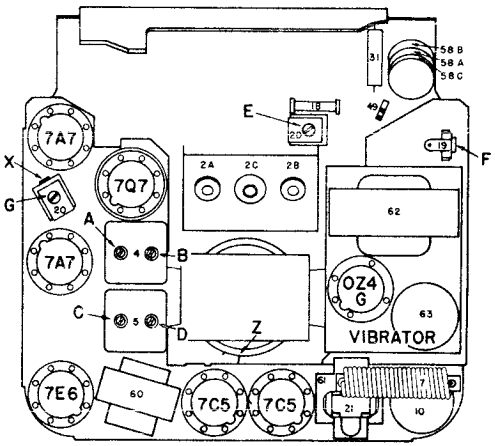
   (e) Adjust the Antenna Trimmer Condenser "F" for maximum output. (See Parts Layout)

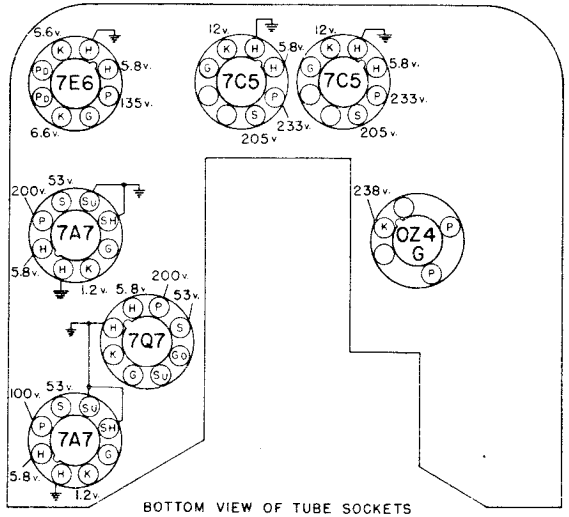
   (f) Adjust the R.F. Trimmer Condenser "G" for maximum output.

NOTE - With permeability tuning it is necessary to adjust the capacity at only one frequency. The coils are so wound that tracking is automatic and the usual low frequency adjustments are not necessary.

If the entire alignment procedure has been accomplished accurately, the receiver should be uniformly sensitive over the entire frequency range.







BOTTOM VIEW OF TUBE SOCKETS

READINGS TAKEN FROM TUBE SOCKET CONTACTS TO GROUND WITH A D.C. VOLTMETER HAVING A RESISTANCE OF 1000 OHMS PER VOLT "A" BATTERY 6.0 VOLTS. CURRENT DRAIN 8.1 AMPERES. "B" SUPPLY DRAIN APPROXIMATELY 60 MA. ALL READINGS ±10%.

ANTENNA CIRCUIT

The Antenna Circuit is directly coupled to the antenna. A small adjustable condenser is provided for adjusting the antenna circuit to the antenna. This adjustment is made near the high frequency end of the band (1400 to 1600 KC.)

AUTOMATIC PUSH BUTTON TUNING

This is accomplished by a mechanical unit of rugged construction assuring accuracy. A special compensating condenser is employed in the oscillator circuit to minimize over-all receiver drift due to normal variation in car voltage and temperature ranges.

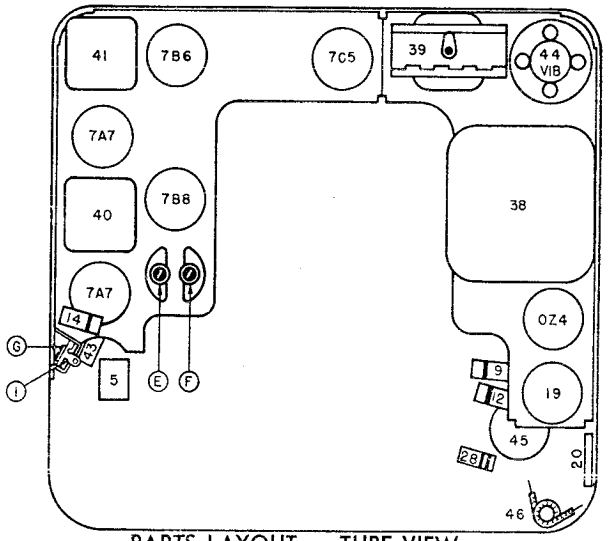
ALIGNMENT PROCEDURE

Volume Control Maximum — Tone Control on treble.

Signal Generator minimum for satisfactory output indication.

Series Condenser Or Dummy Antenna	Connect To	Signal Generator Frequency	Adjust Screws In Order
0.1 MFD	Grid side of Trimmer F	262 KC	A B C D
.000070 MFD	Antenna Terminal	1615 KC	E
.000070 MFD	Antenna Terminal	1430 KC	F G

Adjust trimmer G to match car antenna (1430 KC) when radio is installed.



PARTS LAYOUT — TUBE VIEW

SPECIAL INSTRUCTIONS

Mechanical alignment of iron cores. Tune to stop at H. F. end of dial. Adjust cores H, J, and K to extend $1\frac{5}{32}$" from end of coil form. Adjust trimmers E, F, and G, (1615 KC). Adjust cores H and J for maximum output at 1430 KC. Repeat alignment of trimmers E, F, and G at 1615 KC. Repeat alignment of cores H and J at 1430 KC. Align trimmers F and G at 1430 KC.

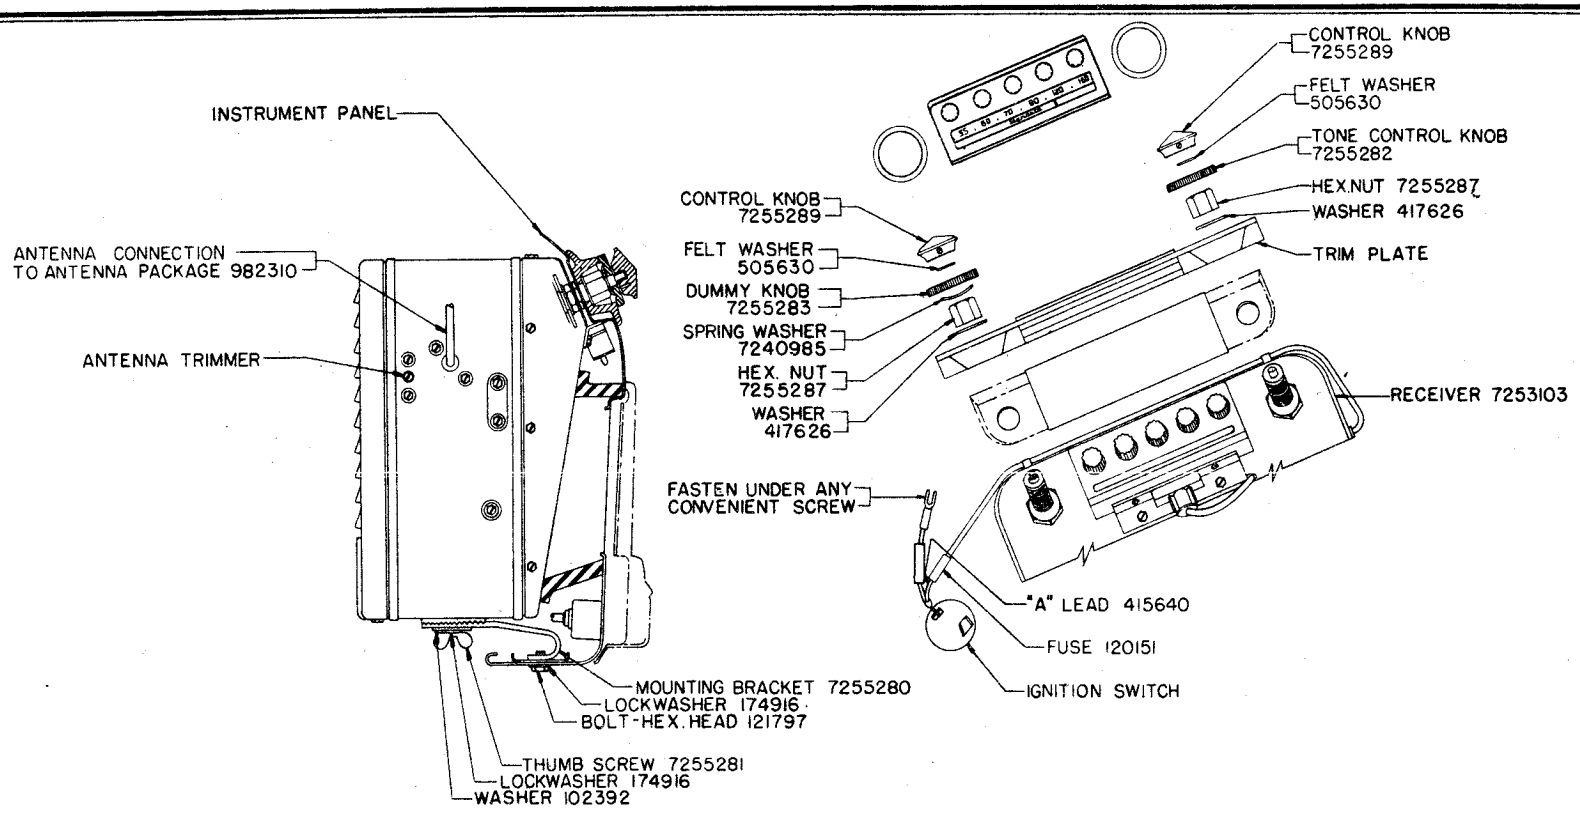

Fig. 7 - Installing The Receiver - 982376

AUTOMATIC PUSH BUTTON TUNER

The iron cored automatic tuner consists of three coils with iron cores actuated by a rugged mechanical device for varying the position of the cores in the coils. Changing the position of the cores changes the inductance of the antenna, R.F. and oscillator coils, and provides a means of tuning the radio over the entire broadcast band. A special compensating condenser is employed in the oscillator circuit to prevent the set from drifting off station due to normal variations in car and radio temperatures.

OLYMPIC RADIO & TELEV. INC.

Equipment Required:

Modulated R.F. signal generator; output meter; insulated screw-driver; two .1 mfd 400 volt and one 50 mmfd 400 volt condensers.

To align the receiver it is necessary to remove the chassis from the cabinet, check that the pointer is horizontal and coincides with the two horizontal reference lines on the dial. In this position the condenser should be completely closed. Connect the output meter and signal generator as follows:

Output meter — Connect across voice coil and turn volume control to maximum.

Signal generator — Connect the low side of the signal generator to the receiver chassis thru a .1 mfd condenser and keep the output as low as possible, then proceed in the sequence shown on the alignment chart.

ALIGNMENT INSTRUCTIONS

Equipment Required:

Modulated r-f signal generator; output meter; insulated screw driver; two .1 mfd 400 volt and one 50 mmfd 400 volt condensers.

The receiver should be aligned with chassis and loop mounted in the cabinet. With the condenser completely closed the pointer should be checked so that it coincides with the two horizontal reference lines on the dial. Connect the output meter and signal generator as follows:

Output meter — Connect across voice coil and turn volume control to maximum.

Signal generator — Connect the low side of the signal generator to the receiver chassis thru a .1 mfd condenser and keep the output as low as possible, then proceed in the sequence shown on the alignment chart.

ALIGNMENT PROCEDURE CHART

8	S.W.		18 MC.	18 MC. CALIBRATION POINT ON DIFFUSER PLATE	C 4 (OSCILLATOR TRIMMER) SECOND PEAK FROM TIGHT POSITION. C 7 (R.F. TRIMMER) SECOND PEAK FROM TIGHT POSITION. C 2 (ANTENNA TRIMMER)
9	S.W.		6 MC.	RESONANCE	CHECK THAT POINTER (AT RESONANCE) COINCIDES WITH 6 MC. CALIBRATION POINT. IF NOT REPEAT STEP 8.
10	S.W.	REPEAT STEPS 8 AND 9			

NOTE: In order to adjust the short wave oscillator trimmer and the short wave r-f trimmer accurately to the fundamental frequency and not to the image signal, turn the trimmers first to the maximum capacity position (fully tight). From this position loosen the trimmer through one peak indication on the outputmeter until a second peak is obtained. Adjust for maximum output on this second peak.

To check whether this procedure has been accurately performed, ascertain that an image signal can be received (much weaker) by tuning the signal generator to a frequency 910 kilocycles above the alignment frequency.

SERVICE AND ALIGNMENT INSTRUCTIONS

To insure proper alignment, it is suggested to use a radiated signal. To radiate a signal connect a loop of about 6" to 8" diameter, 1 turn of #14 or #12 wire across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned, at a distance of about 8" or 10".

Equipment required: Modulated r-f signal generator, output meter, insulated screw driver, one .1 mfd 400 volt condenser.

With the receiver removed from the cabinet, connect output meter across voice coil. Connect ground side of the signal generator to receiver chassis. Turn volume control fully on, and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

To facilitate alignment of the receiver, when removed from cabinet, calibration points are provided on the light diffuser plate which is mounted on the chassis. These points are from left to right.

.(Dot, Reference point); 600 kc; 1000 kc; 1400 kc; 1700 kc for the broadcast band and .(Dot, reference point); 6 mc; 12 mc; 18 mc for the short wave band.

Before aligning close the variable condenser fully counterclockwise (plates fully closed) and check that pointer coincides with the reference dot (extreme left dot) on the diffuser plate.

MODEL 6-606

OLYMPIC RADIO & TELEV. INC.

SERVICE AND ALIGNMENT INSTRUCTIONS

WHEN SERVICING THIS RECEIVER DO NOT PLACE CHASSIS ON A GROUNDED METALLIC BENCH.

For tube replacement it is not necessary to remove the chassis from the cabinet. Access to the tubes may be made by removing the center screw on the loop holding same to the bracket, and then lifting loop carefully off the bracket so as to avoid breaking of wires connecting same.

For ALIGNMENT the chassis must be removed from case. Remove first batteries and then the three screws holding chassis to the bottom of the shelf.

ALIGNMENT

Equipment Required: Modulated r-f signal generator; output meter; insulated screw driver; two .1 mfd 400 volt and one 50 mmfd 400 volt condensers.

Turn variable condenser fully counterclockwise (plates fully closed) and check that pointer coincides with the first thin calibration mark on the dial. Connect the output meter and signal generator as follows:

Output meter: Connect across voice coil and turn volume control to maximum.

Signal generator: Connect the low side of the signal generator to the receiver chassis thru a .1 mfd condenser and keep output as low as possible, then proceed in the sequence shown on the alignment chart.

SERVICE AND ALIGNMENT INSTRUCTIONS

To service this receiver it is first necessary to remove the motorboard with the record changer and then remove the chassis through the top opening of the cabinet. To lift the entire motorboard with the changer, unfasten the six screws holding the motorboard in place, disconnect motor and pick-up plugs from chassis, and lift up. It is unnecessary to remove the screws holding the metal-shield in front. CAUTION: WHEN REMOVING THE CHANGER BE SURE TO PLACE IT IN A POSITION WHEREBY THE CHANGER MECHANISM WILL NOT BE DAMAGED.

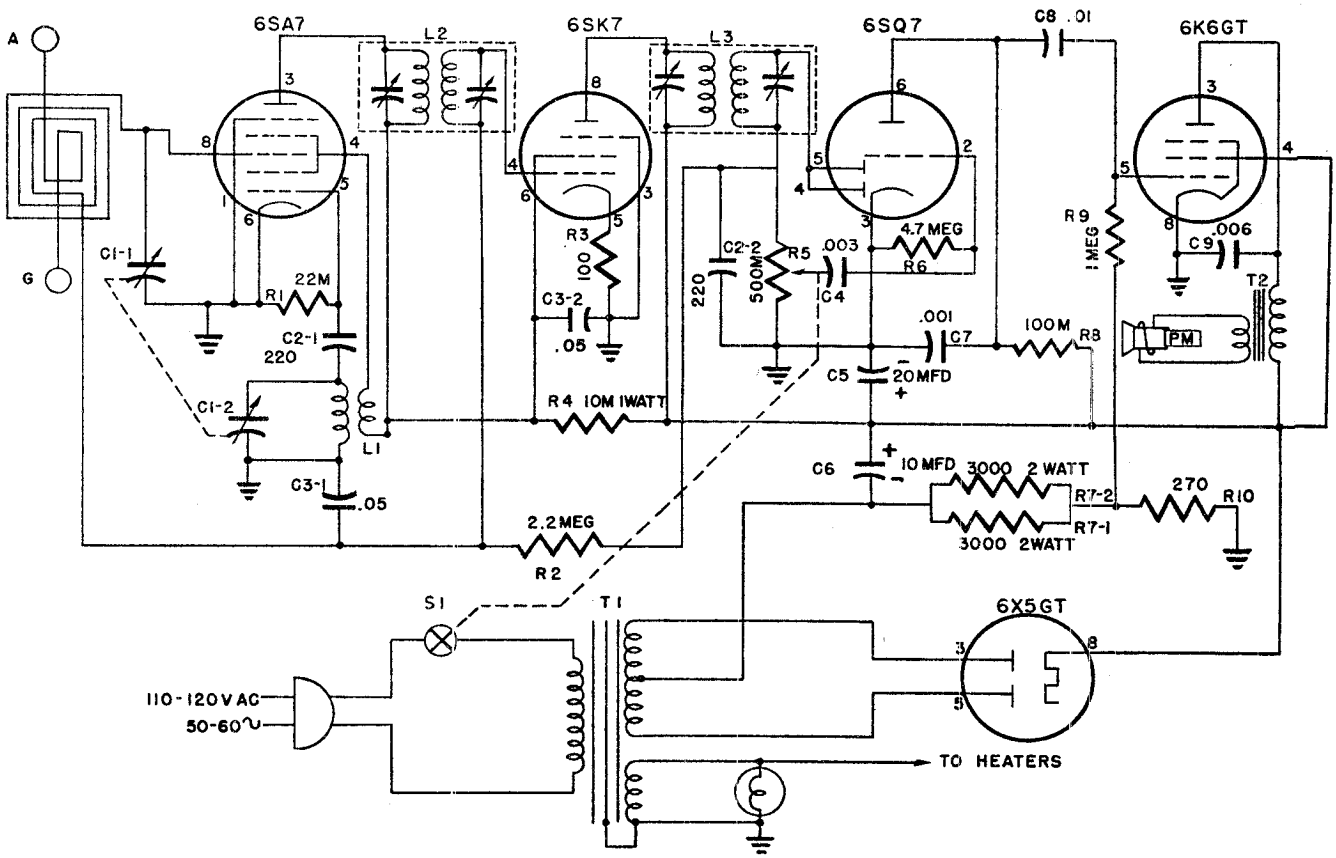
Equipment Required: Modulated r-f signal generator; output meter; insulated screw driver; one .1 mfd 400 volts and one 50 mmfd 400 volts condenser.

With the receiver removed from the cabinet, connect output meter across voice coil. Connect ground side of the signal generator to chassis; turn volume control fully on, and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

To facilitate alignment of the receiver when removed from cabinet, calibration points are provided on the pointer slide bar (see drawing).

Before aligning, close the variable condenser fully counterclockwise (plates fully closed) and check that pointer carriage coincides with the "reference line" on the pointer slide bar.

PACKARD BELL CO.



ALIGNMENT PROCEDURE

Alignment procedure consists of the four steps outlined in the Alignment Procedure Chart. Test oscillator leads should be connected to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for the I. F. alignment (Step No. 1).

The alignment procedure outlined in steps 2 to 4 utilizes a standard test loop.* The test oscillator leads should be connected across this loop. The loop should be placed about two feet from the receiver loop in a vertical position.

Upon completion of the I. F. Alignment the variable condenser should be "Rocked" to gain assurance that the I. F.'s have not been aligned to the image frequency.

*NOTE: Hazeltine Test Loop #1150

ALIGNMENT PROCEDURE

Alignment Procedure consists of the four steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with a .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. The receiver loop must be shifted in order to reach trimmers A, B, C, and D (see Fig. 1). Return the loop to its original position before proceeding with the balance of the alignment.

Upon completion of the I.F. Alignment, the variable condenser should be "Rocked" to assure that the I.F.s have not been aligned to the image frequency.

The procedure outlined in steps 2 to 4 utilizes a standard test loop*. Connect the test oscillator leads across this loop and place it in a vertical position about two feet from the receiver loop.

*NOTE: Hazeltine Test Loop No. 1150.

GENERAL INFORMATION

Model 561 is a five tube superheterodyne receiver and phonograph combination. This model employs a permanent magnet speaker and a "HI-Q" loop antenna. It is enclosed in a fabricoid covered carrying case.

The schematic diagram shows a tweet filter network in the 2nd I.F. This network is comprised of two 100 Mmf capacitors and a 56,000 ohm resistor. Also shown is a .005 Mfd. capacitor parallel with the primary of the output transformer. In a few of the earlier models a 220 Mmf. AVC by-pass was used in place of the tweet filter, and the .005 Mfd. capacitor is connected to the plate of the 6K6-GT and ground.

ALIGNMENT PROCEDURE

Alignment procedure consists of the four steps outlined in the Alignment Procedure Chart.

For step No. 1, I.F. Alignment, connect the test oscillator leads to the mixer grid and ground in series with a .01 Mfd. capacitor (dummy load). Upon completion of this step, "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Steps 2 to 4 employ a standard test loop.* Connect the test oscillator leads across this loop and place it in a vertical position about two feet from the receiver loop.

*NOTE: Hazeltine Test Loop #1150.

GENERAL INFORMATION

Model 563 is a combination superheterodyne receiver and phonograph. This model employs a permanent magnet speaker and a specially designed "Hi Q" loop antenna. The model is capable of playing ten or twelve-inch records and is enclosed in a fabricoid covered carrying case.

ALIGNMENT PROCEDURE

Alignment procedure consists of the four steps outlined in the Alignment Procedure Chart.

For step No. 1, I.F. Alignment, connect the test oscillator leads to the mixer grid and ground in series with a .01 Mfd. capacitor (dummy load). Upon completion of this step, "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Steps 2 to 4 employ a standard test loop.* Connect the test oscillator leads across this loop and place it in a vertical position about two feet from the receiver loop.

*NOTE: Hazeltine Test Loop #1150.

ALIGNMENT CHART

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAXIMUM OUTPUT

STAGE GAIN MEASUREMENTS

Measurements taken with volume control maximum, and switch in RADIO position. AVC shorted out.
Standard Output . . . 50 milliwatts
Dummy Antenna . . . 200 Mmf.
Antenna to Converter Grid . . . 4.65 X at 1000 KC
Converter Grid to 1st I.F. Grid . . . 79 X at 1000 KC
Converter Grid to 1st I.F. Grid . . . 95 X at 455 KC
1st I.F. Grid to 2nd Detector . . . 62.3 X at 455 KC
Overall Audio Gain . . . 700 X at .5 watts 400 cycles

OSCILLATOR GRID VOLTAGES

Measured at Oscillator grid to ground, no signal, with A.C. V.T.V.M. input loading above 10 megohms. 117 volts A.C. line voltage. Switch in RADIO position.

1750 KC . . . 19.8 volts AC
1300 KC . . . 19.8 volts AC
750 KC . . . 18.3 volts AC
570 KC . . . 17.2 volts AC

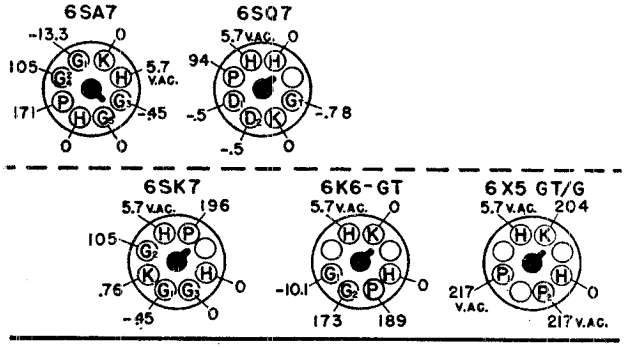

FIG. 1—SOCKET VOLTAGES

Electrical Rating
Line Voltage . . . 110-120 volt 50-60 cycle A.C.
Power Consumption . . . 48 watts

Tuning Frequency Range
540 to 1750 KC

Intermediate Frequency
455 KC

Electrical Power Output
Maximum . . . 2.3 watts

Loudspeaker
Type . . . Permanent Magnet
Outside Cone Diameter . . . 5"
Voice Coil Impedence . . . 3.2 ohms at 400 cycles
Magnet Rating . . . 2.5 oz. Alnico #5

Tubes
6SA7 . . . Frequency Converter
6SK7 . . . I.F. Amplifier
6SQ7 . . . Detector Amplifier
6K6-GT . . . Power Amplifier
6X5-GT/G . . . Rectifier

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis. A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis.

Volume control . . . maximum — No signal

117 volts A.C. line voltage

Switch in radio position

All voltages shown are positive D.C. unless otherwise noted.

MODEL 566

PACKARD BELL CO.

1st I.F. Coil

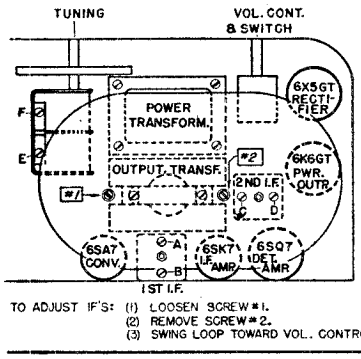
primary . . . 14.5 ohms
secondary . . . 14.5 ohms

2nd I.F. Coil

primary . . . 14.5 ohms
secondary . . . 14.5 ohms

Oscillator Coil

start to finish . . . 8 ohms
start to tap . . . 7 ohms



TO ADJUST IF'S: (1) LOOSEN SCREW #1.
(2) REMOVE SCREW #2.
(3) SWING LOOP TOWARD VOL. CONTROL.

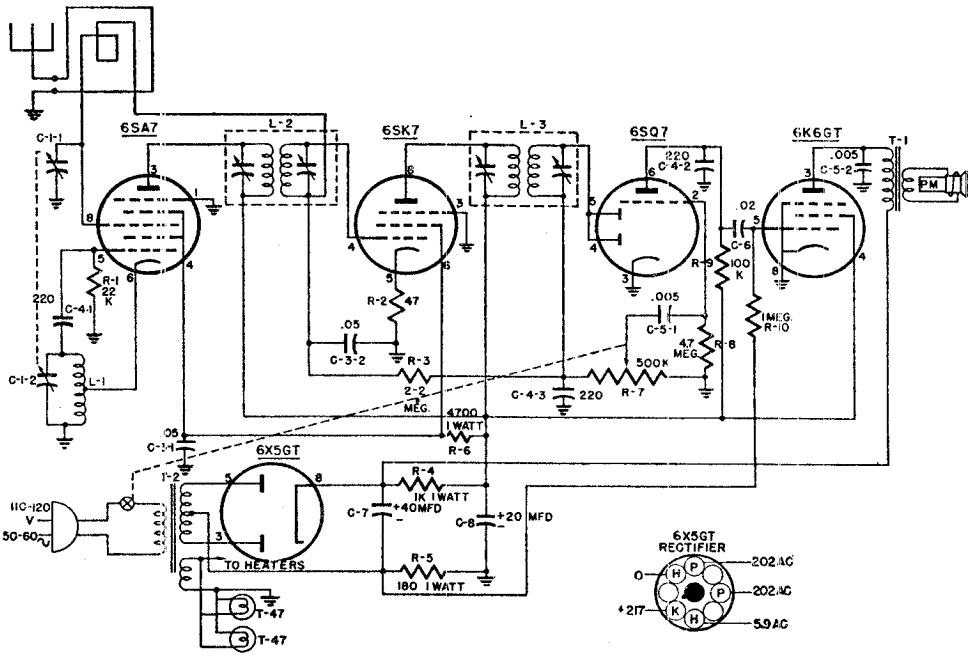


Fig. 1 — Trimmer Location

Alignment Procedure consists of the four steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with a .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. The receiver loop must be shifted in order to reach trimmers A, B, C, and D (see Fig. 1). Return the loop to its original position before proceeding with the balance of the alignment.

Upon completion of the I.F. Alignment, the variable condenser should be "Rocked" to assure that the I.F.s have not been aligned to the image frequency.

The procedure outlined in steps 2 to 4 utilizes a standard test loop*. Connect the test oscillator leads across this loop and place it in a vertical position about two feet from the receiver loop.

*NOTE: Hazeltine Test Loop No. 1150.

ALIGNMENT CHART

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAXIMUM OUTPUT
1	Mixer grid & Grd. .01 Mfd. Dummy Load	455 KC	550 KC	Trimmers A, B, C & D
2	Standard Test Loop*	1740 KC	1740 KC	Trimmer F to 1750 KC

ALIGNMENT PROCEDURE

The alignment procedure consists of the eight steps outlined in the alignment procedure chart.

Connect the test oscillator leads to the mixer grid and ground in series with a .01 mfd. capacitor (dummy load) for steps 1 and 2, I.F. alignment. The receiver loop must be shifted in order to reach trimmers A, B, C, and D (see Fig. No. 1). Return the loop to its original position before proceeding with the balance of the alignment.

Upon completion of the I.F. alignment, the variable condenser should be "Rocked" to assure that the I.F.s have not been aligned to the image frequency.

The procedure outlined in steps 3 to 5 utilizes a standard test loop.* Connect the test oscillator leads across this loop and place it about two feet from the receiver loop in a vertical position.

Steps 6 and 7 cover the short wave alignment. Connect the test oscillator leads to the short wave antenna and ground in series with a 400 ohm resistor.

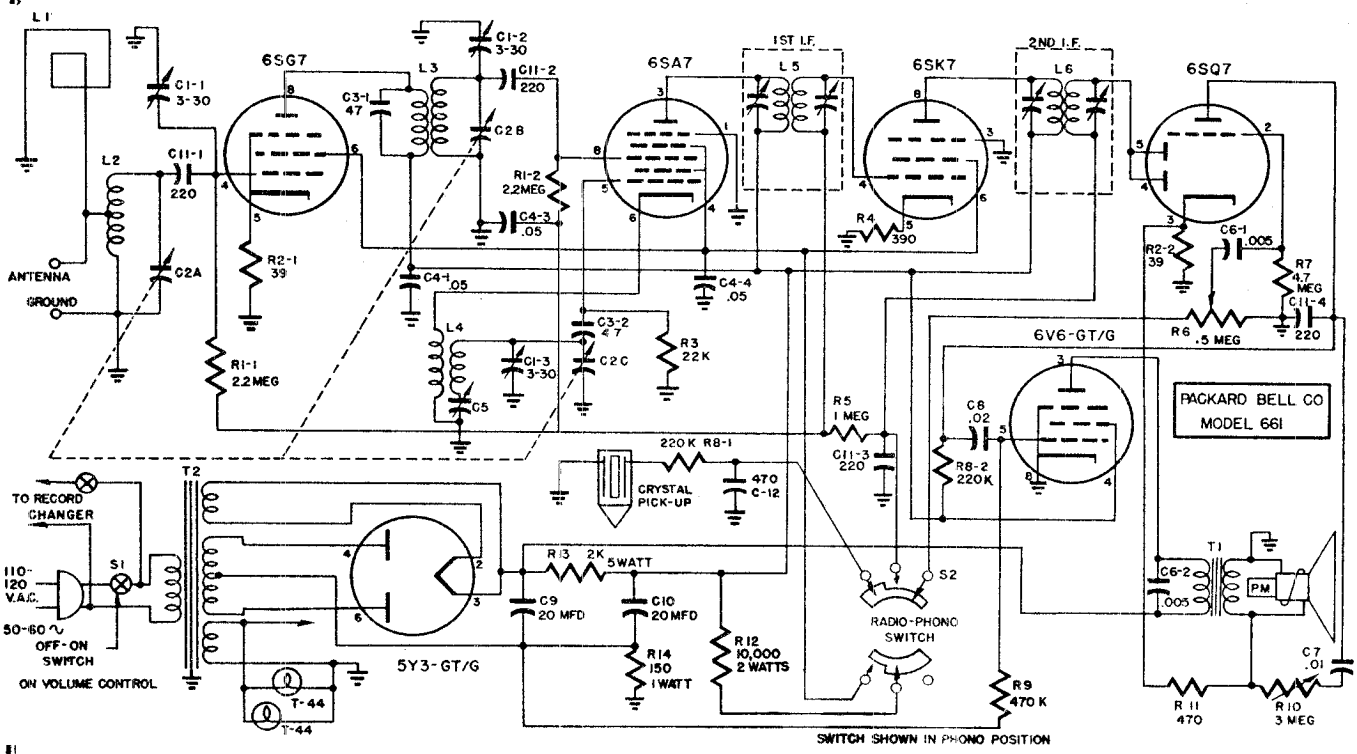
MODEL 661

PACKARD BELL CO.



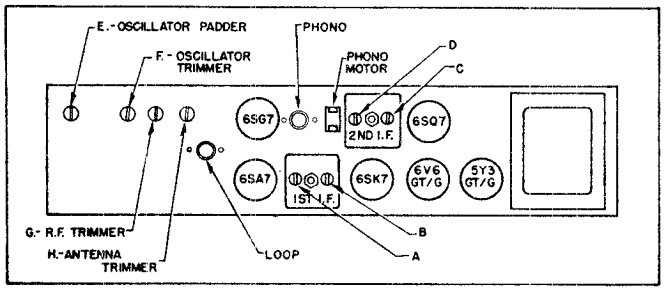


FIG. 2 TRIMMER LOCATION

ALIGNMENT PROCEDURE

Alignment procedure consists of the 5 steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1. I.F. Alignement. Upon completing this step "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Use the Hazeltine Standard Test Loop No. 1150, or a reasonable substitute, for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

It will be noted that all alignment trimmers are accessible without removing the chassis from the cabinet. (See Fig. 2, Trimmer location.)

ALIGNMENT CHART

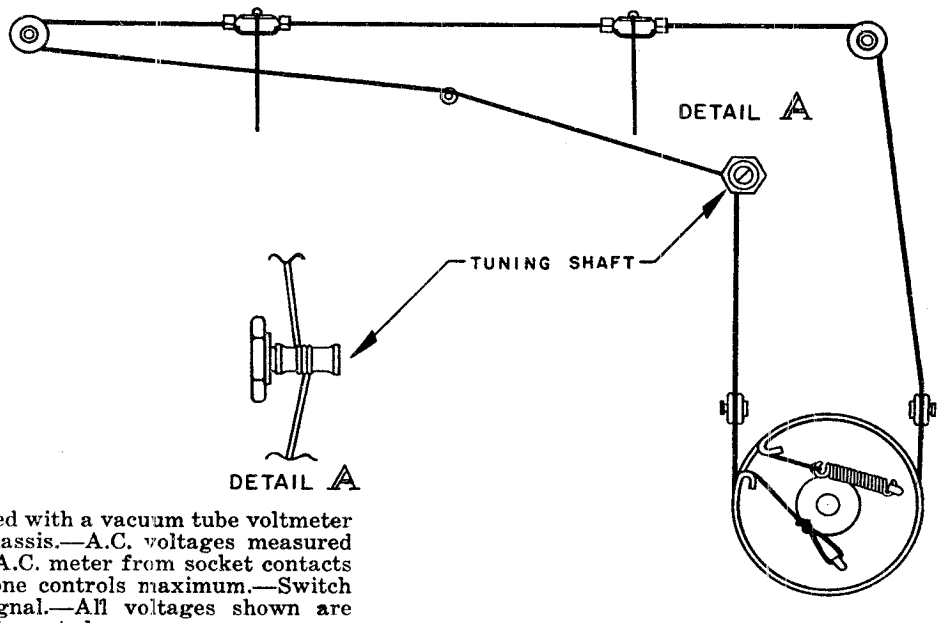
PACKARD BELL CO.



All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis.—A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis.—Volume and tone controls maximum.—Switch in Radio position.—No signal.—All voltages shown are positive D.C. unless otherwise noted.

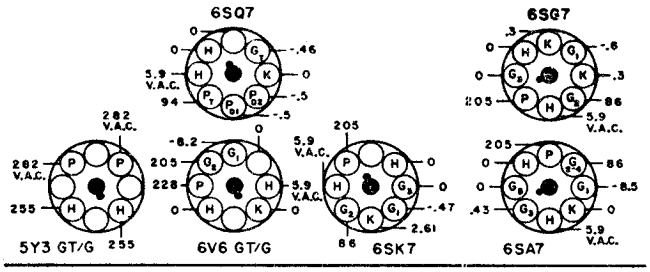


FIG. 1 SOCKET VOLTAGES

STAGE GAIN MEASUREMENTS:

Measurements taken with volume and tone controls maximum.

Switch in RADIO position.

AVC shorted out.

Standard Output . . . 50 milliwatts

Dummy Antenna . . . 200 Mmf.

Antenna to R.F. Grid . . . 4X at 1000 KC
R.F. Grid to Converter Grid . . . 21X at 1000 KC
Converter Grid to 1st I.F. Grid . . . 32X at 1000 KC

1st I.F. Grid to 2nd Detector . . . 48X at 455 KC
Overall Audio Gain . . . 253X at .5 watts 400 cycles

OSCILLATOR CATHODE VOLTAGES:

Measured at 120 volts AC line voltage with AC vacuum tube voltmeter input loading above 10 megohms.

1500 KC . . . 2.75 volts AC
1000 KC . . . 2.5 volts AC
800 KC . . . 2.62 volts AC
600 KC . . . 2.9 volts AC

D.C. RESISTANCE MEASUREMENTS:

1st & 2nd I.F. Coils		**Antenna Coil**	
Primary	14.5 ohms	Start to Tap	1.5 ohms
Secondary	14.5 ohms	Start to Finish	2 ohms
Oscillator Coil		**R.F. Coil**	
Primary	1 ohm	Primary	58 ohms
Secondary	6 ohms	Secondary	4.2 ohms

NOTE: Due to the variation of winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

The permanent magnet speaker contained in this model is equipped with the ADJUST-A-CONE feature. This feature provides the radio service technician with a quick and simple means of centering an "Off Center" or "Dragging" voice coil.

Centering the voice coil is accomplished by simply adjusting the two screws on the spider support until the voice coil moves freely in the air gap. This adjustment is very critical, consequently the use of an audio oscillator is recommended. Set the audio oscillator at cone resonance, which should be approximately 120 cycles, when making this adjustment.

In most cases, a very slight turn of either adjustment screw will correct an "Off Center" voice coil.

In the first run of sets a 39 ohm resistor was used in the cathode circuit of the 6SG7. This resistor has been replaced by a 220 ohm resistor. This change was made to stabilize the R.F., thereby eliminating critical dressing of leads surrounding the 6SG7.

Electrical Rating:
Line Voltage . . . 110-120 volts, 50-60 cycle A.C.
Power Consumption . . . 68 watts

Tuning Frequency Range:
540 to 1740 KC

Intermediate Frequency:
455 KC

Electrical Output:
Maximum . . . 4 watts

Loudspeaker:
Type . . . Permanent Magnet
Outside Cone Diameter . . . 6½"
Voice Coil Impedance . . . 3.5 ohms at 400 cycles
Magnet Rating . . . 2.15 Oz. Alnico 5

Tubes:

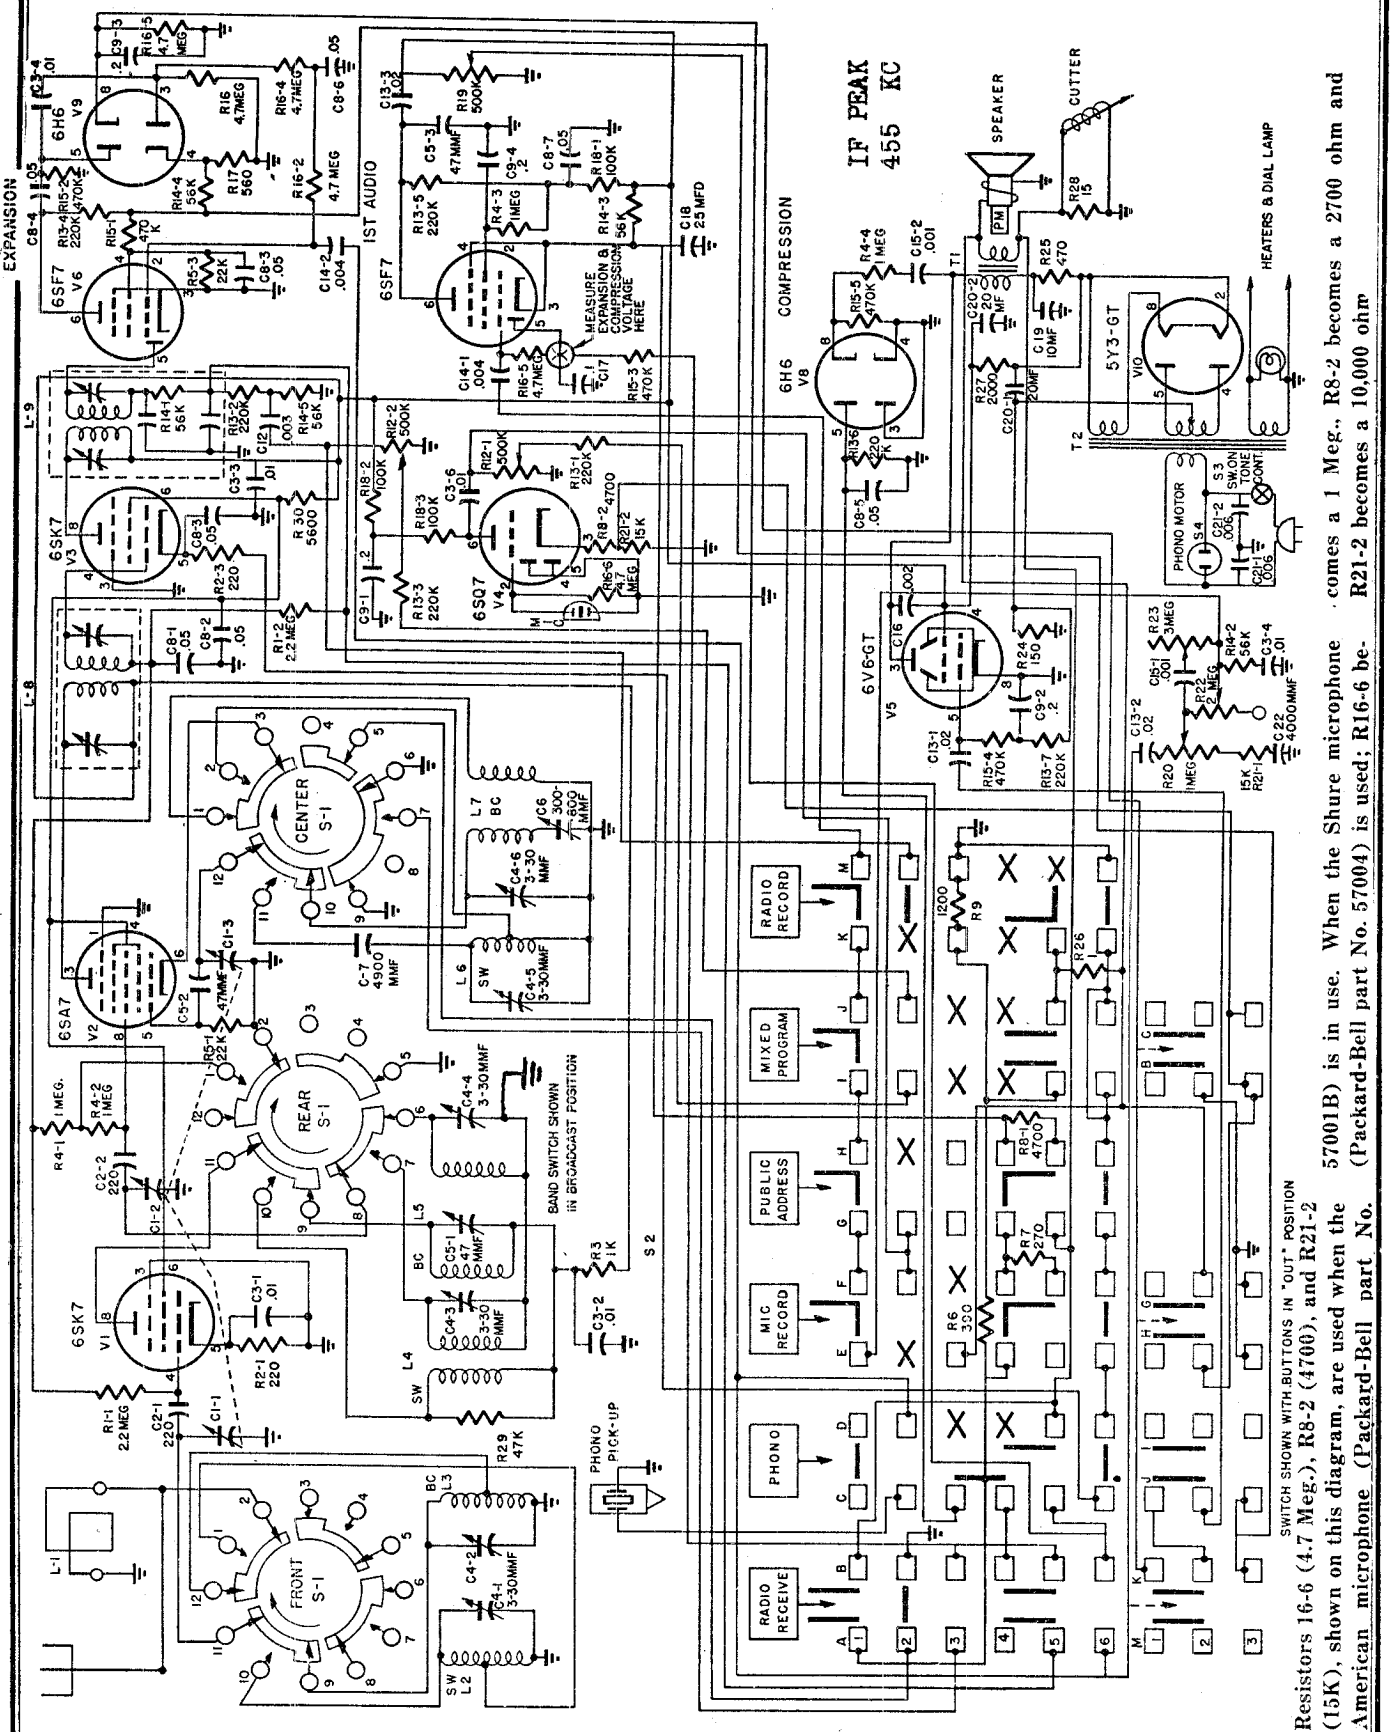
PACKARD BELL CO.



Resistors 16-6 (4.7 Meg.), R8-2 (4700), and R21-2 (15K), shown on this diagram, are used when the 57001B) is in use. When the Shure microphone comes a 1 Meg., R8-2 becomes a 2700 ohm and American microphone (Packard-Bell part No. (Packard-Bell part No. 57004) is used; R16-6 be- R21-2 becomes a 10,000 ohm

PACKARD BELL CO.

Expanson is switched into grid of 1st audio, (6SF7) when "RADIO RECEIVE" button is depressed by connecting switch contacts B-5 and B-6.

Expansion is switched into grid of 1st audio, (6SF7) when "PHONO" button is depressed by connecting switch contacts C-4 and C-5.

Expansion is in the circuit ONLY when the "RADIO RECEIVE" and "PHONO" buttons are depressed.

Compression switched out of Radio Receive by breaking contact from B-4 to B-5.

Compression switched out of Phonograph by breaking contact from C-3 to C-4.

Compression is in circuit on ALL RECORD POSITIONS and PUBLIC ADDRESS.

ALIGNMENT PROCEDURE

Alignment procedure consists of the 7 steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. alignment. Upon completing this step, "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Use the Hazeltine Standard Test Loop #1150 for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

Step	*Connect Test Osc. To*	*Test Osc. Setting*	*Pointer Setting*	*Adjustment For Maximum Output*
1	Mixer Grid & Grd. .01 Mfd. Capacitor	455 KC	540 KC	Trimmers ABC & D
2	Standard Test Loop*	1750 KC	1750 KC	Trimmer F to 1750 KC
3	Standard Test Loop*	600 KC	600 KC	Trimmer G to 600 KC
4	Standard Test Loop*	1500 KC	1500 KC	Trimmers I & J
5	Repeat Steps 2, 3 & 4			----
6	Standard Test Loop*	18 MC	18 MC	Trimmer E to 18 MC
7	Standard Test Loop*	15 MC	15 MC	Trimmers K & H

***REMARKS: Hazeltine Test Loop No. 1150.**

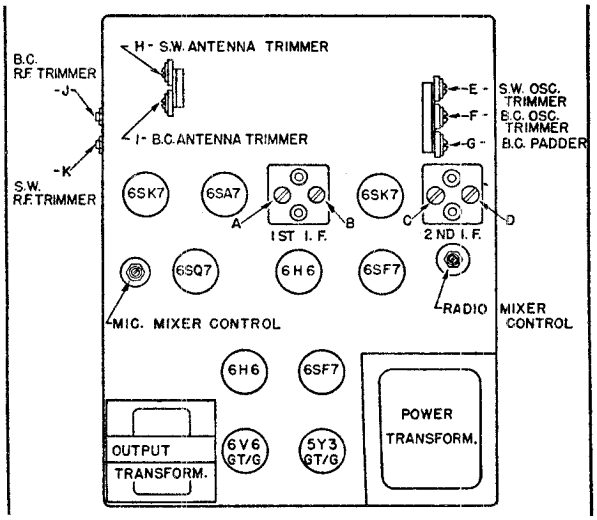

FIG. 1 TRIMMER LOCATION

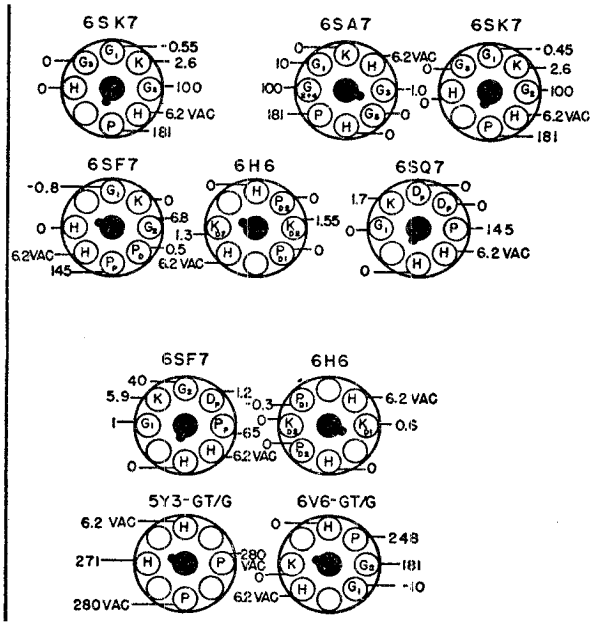

FIG. 2 VOLTAGE CHART

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis. A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. Volume control maximum. No signal. 117 volts A.C. line voltage. All voltages shown are positive D.C. unless otherwise noted.

Recording Head Pressure

The proper recording head pressure may be identified by the small red dot painted on the indicator on the cutter arm. This pressure is 1¼ Oz.

Brief Description of Expansion and Compression Circuits

V6, 6SF7 and V9, 6H6 embrace the expansion circuit. Referring to Figure 3, Schematic Diagram, it will be noted that expansion is present in the circuit at all times on Phono and Radio Receive. V6, 6SF7 serves as the 2nd Detector and expansion amplifier, while V9, 6H6 functions as the expansion rectifier in one diode section and furnishes delayed audio AVC in the other diode section. V8, 6H6 functions as the compressor.

How to Check Expansion Voltage

The following method is suggested for checking expansion voltage.

Feed a 1 volt (RMS) 400 cycle signal into the phono input plug. Make certain the phono button is depressed. Connect the leads of a vacuum tube voltmeter* to the location indicated on Figure 3, Schematic Diagram and ground. The voltage at this point should be between 3 and 4 volts positive DC. As a cross check measure the cathode voltage of V7, 6SF7 which should read about 5 volts DC. The expansion voltage should be approximately 1 volt less.

How to Check Compression Voltage

Depress the Radio Record button. Feed a 1 volt (RMS) 400 cycle signal into the diode return of the 2nd I.F. (brown lead). In the same manner outlined in the preceding paragraph measure the compression voltage, which should be approximately a minus 2 to 3 volts DC.

***NOTE: VTVM input loading above 10 megohms.**

No signal.
117 volts A.C. line voltage.

All voltages measured from socket contacts to chassis. D.C. voltages measured with a vacuum tube voltmeter. A.C. voltages measured with a 1000 ohm per volt A.C. meter.

Volume and tone controls maximum.

Band switch in standard broadcast position.

Compression switched out of Radio Receive by breaking contact from B-4 to B-5.

Compression switched out of Phonograph by breaking contact from C-3 to C-4.

Compression is in circuit on ALL RECORD POSITIONS and PUBLIC ADDRESS.

All voltages shown are positive D.C. unless otherwise noted.

Expanson is switched into grid of 1st audio, (6SF7) when "RADIO RECEIVE" button is depressed by connecting switch contacts B-5 and B-6.

Expansion is switched into grid of 1st audio, (6SF7) when "PHONO" button is depressed by connecting switch contacts C-4 and C-5.

Expansion is in the circuit ONLY when the "RADIO RECEIVE" and "PHONO" buttons are depressed.

ALIGNMENT PROCEDURE

Alignment procedure consists of the 7 steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. Upon completing this step, "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Use the Hazeltine Standard Test Loop #1150 for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

7	Standard Test Loop*	15 MC	15 MC	Trimmers E & K

*NOTE: Hazeltine Test Loop #1150.

BRIEF DESCRIPTION OF EXPANDER AND COMPRESSOR CIRCUITS

V7 6SF7 and V6 6H6 embrace the expansion circuit. Referring to Figure 3, Schematic Diagram, it will be noted that volume expansion is in the circuit at all times when the Phono or Radio receive buttons are depressed. V7, 6SF7 serves as the 2nd detector and expansion amplifier. V6, 6H6 functions as the expansion rectifier in one diode section and furnishes delayed audio AVC in the other diode section. V8, 6H6 functions as the compressor rectifier.

HOW TO CHECK EXPANSION VOLTAGE

Feed a 1 volt (RMS) 400 cycle signal into the Phono input plug. Make certain the Phono button is depressed. Connect the leads of a vacuum tube voltmeter* to the location indicated on Figure 3, Schematic Diagram and ground. The voltage at this point should be between 3 and 4 volts positive D.C. As a cross check measure the cathode voltage of V4, 6SF7, which should read about 5 volts D.C. The expansion voltage should be about 1 volt less.

HOW TO CHECK COMPRESSION VOLTAGE

Depress the Radio Record button. Feed a 1 volt (RMS) 400 cycle signal into the diode return of the 2nd I.F. (brown lead). In the same manner outlined in the preceding paragraph, measure the compression voltage, which should be approximately a minus 2 to 3 volts.

*VTVM: Input loading above 10 megohms.

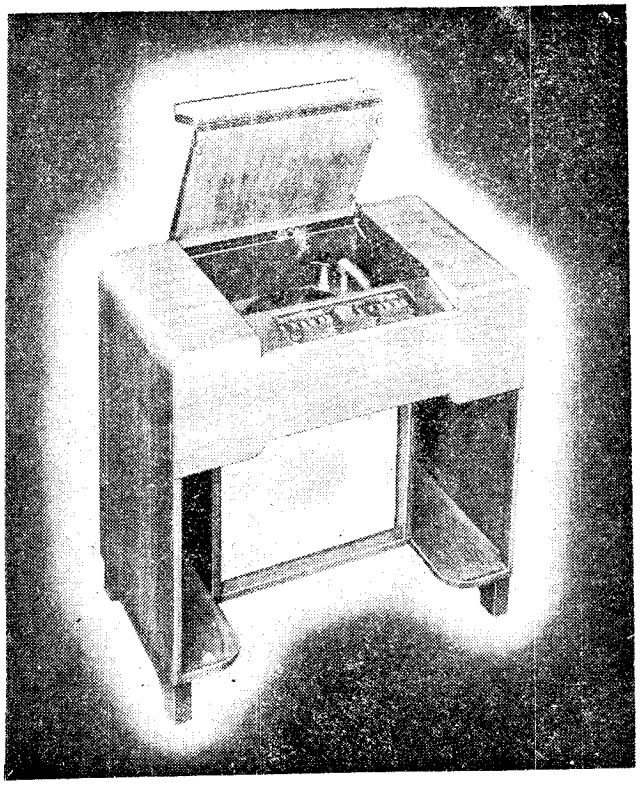
MODEL 662

PACKARD BELL CO.



SPECIFICATIONS

Overall Dimensions:
Height . . . . 26⅞" Depth . . . . 18½"
Width . . . . 29⅞" Weight . . . 70 Lbs.

Electrical Rating:
Line Voltage . . . 110-120 volts, 50-60 cycle A.C.
Power Consumption . . . 67 watts

Tuning Frequency Range:
540 to 1740 KC

Intermediate Frequency:
455 KC

Electrical Output:
5 watts maximum

Loudspeaker:
Type . . . Permanent Magnet
Outside Cone Diameter . . . 10"
Voice Coil Impedance . . . 3.5 ohms at 400 cycles
Magnet Rating . . . 4.64 Oz. Alnico 5

Tubes:

Tube	Function
6SK7	R.F. Amplifier
6SA7	Frequency Converter
6SK7	I.F. Amplifier
6SQ7	Detector-Amplifier
6V6-GT/G	Power Amplifier
5Y3-GT/G	Rectifier

GENERAL INFORMATION

Model 662 is a console, radio-phonograph combination with an automatic record changer. This model employs a specially designed high impedance loop antenna and a permanent magnet speaker. It is housed in a wood cabinet of bleach or walnut design.

For service information concerning the record changer, refer to the Model 550 Automatic Record Changer Manual. This record changer is also used on Packard-Bell Model 661.

Chassis mounting procedure will be found on the tube layout-license label.

To Service tubes, remove plate in record changer compartment.

Referring to Figure 4, Record Changer Motor Diagram, a 50 ohm, 10 watt resistor will be noted in series with the motor. This resistor was added after an early run to avoid motor heating on 50 cycle current. The resistor is enclosed in a small metal shield. The addition of this resistor does not, in any manner, detract from the efficiency of the motor on 50 or 60 cycle operation.

ALIGNMENT PROCEDURE

Alignment Procedure consists of the 5 steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. Upon completion of this step "Rock" the variable condenser to assure that the I.F.s have been aligned to the correct frequency. Output should remain constant for any setting of variable capacitor.

Use the Hazeltine Standard Test Loop No. 1150, or a reasonable substitute, for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

It will be noted that all alignment trimmers are accessable without removing the chassis from the cabinet.

IMPORTANT NOTICE: Make certain that each alignment is done with a minimum input signal.

ALIGNMENT CHART

	CONNECT TEST OSC.	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
STEP 1	Mixer Grid & Grd. (.01 Mfd. Cap.)	455 KC	540 KC	Trimmers A, B, C & D
2	Standard Test Loop*	1740 KC	1740 KC	Trimmer G to 1740 KC
3	Standard Test Loop*	600 KC	Rock Variable	Padder E
4	Standard Test Loop*	1500 KC	1500 KC	Trimmers F & H
5	Repeat Steps 2, 3, & 4			

NOTE: Hazeltine Test Loop No. 1150 (or a reasonable substitute)

PACKARD BELL CO.

SPECIAL SERVICE INFORMATION

D.C. Resistance Measurements:

1st & 2nd I.F. Coils
Primary . . . 17 ohms
Secondary . . 17 ohms*
Oscillator Coil
Primary . . . . 1 ohm
Secondary . . . 6 ohms
R.F. Coil
Primary . . . 58 ohms
Secondary . . . 4.2 ohms

NOTE: To obtain the true reading of the secondary of the 2nd I.F. Coil, it must be removed from the can. This is so because of the 47K resistor inside the can.

NOTICE: The D.C. Resistance measurements on all coils are subject to a 20% tolerance due to the variation of winding methods.

STAGE GAIN MEASUREMENTS:

Measurements taken with volume and tone controls maximum.
Switch in RADIO position.
AVC shorted out.
Standard Output . . . 50 milliwatts
Dummy Antenna . . . 200 Mmf.

Antenna to R.F. Grid . . . 6X at 1000 KC
R.F. Grid to Converter Grid . . . 7X at 1000 KC
Converter Grid to 1st I.F. Grid . . . 46X at 455 KC
1st I.F. Grid to 2nd Detector . . . 62X at 455 KC
Overall Audio Gain . . . 320X at .5 watts 400 cycles

OSCILLATOR CATHODE VOLTAGES:

Measured at 120 volts AC line voltage with AC vacuum tube voltmeter input loading above 10 megohms.

1500 KC . . . 2.25 volts AC
1000 KC . . . 2.15 volts AC
800 KC . . . 2.3 volts AC
600 KC . . . 2.5 volts AC

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis. — A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. — Volume and tone controls maximum. — Switch in Radio position. — No signal. — All voltages shown are positive D.C. unless otherwise noted.

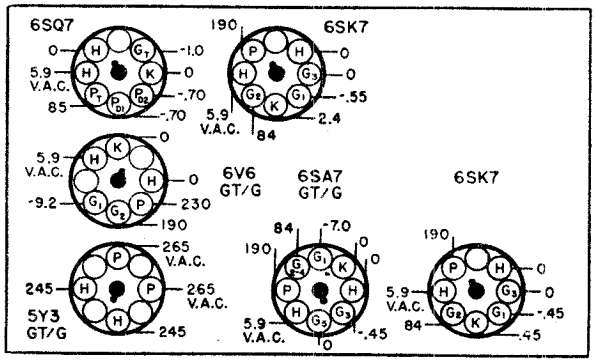

FIGURE 1 SOCKET VOLTAGES

ALIGNMENT

PHILCO 46-250

Alignment may be accomplished with the chassis in the cabinet if a small alignment screwdriver is used. Connect the output meter between the left hand terminal (high) and center terminal (low) of the chassis antenna terminal strip. Connect the signal generator to the standard Hazeltine loop Model 1150 and couple it loosely to the receiver loop. The volume control should be set at maximum. The tuning condenser plates should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The generator output should always be just sufficient to obtain a minimum indication on the output meter. Set the signal generator to 455 kc. and adjust the i-f trimmers for maximum meter deflection in the following sequence: C9, C8, C7, C6. Set the generator and receiver to 1600 kc. and adjust the oscillator trimmer C4 for maximum output. Set the generator and receiver to 1500 kc. and adjust the r-f trimmer C1 for maximum output.

ALIGNMENT

PHILCO 46-350

The receiver should be aligned with the chassis installed in the cabinet. Connect the output meter from the voice coil lug (green wire) on the speaker to ground. Disconnect the blue external antenna lead from ground. Connect the signal generator through a .01 mf condenser to the external antenna lead. Set the receiver volume control at maximum. The tuning condenser should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The signal generator output should at all times be just sufficient to obtain a minimum deflection on the output meter. Set the signal generator to 265 kc. and adjust the intermediate frequency amplifier transformer trimmers for maximum meter deflection in the following sequence: C18, C17, C16, C15. Set the generator and receiver to 1600 kc. and adjust the oscillator shunt trimmer C12 for maximum output. Set the generator and receiver to 580 kc. and adjust the oscillator series padder C10 for maximum output. Proper low frequency adjustment of the oscillator requires rocking the receiver dial slightly while adjusting this trimmer for maximum output. Repeat the adjustment of the oscillator shunt trimmer C12 at 1600 kc. Set the generator and receiver to 1500 kc. and adjust the mixer trimmer C8 and the r-f trimmer C5 for maximum output.

ALIGNMENT

PHILCO 46-420

Alignment may be accomplished with the chassis in the cabinet if a small alignment screwdriver is used. Connect the output meter between the left hand terminal (high) and center terminal (low) of the chassis antenna terminal strip. Connect the signal generator to the standard Hazeltine loop Model 1150 and couple it loosely to the receiver loop. The volume control should be set at maximum. The tuning condenser plates should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The generator output should always be just sufficient to obtain a minimum deflection on the output meter. Set the signal generator to 455 kc. and adjust the i-f trimmers for maximum meter deflection in the following sequence: C9, C8, C7, C6. Set the generator and receiver to 1600 kc. and adjust the oscillator trimmer C4 for maximum output. Set the generator and receiver to 1500 kc. and adjust the r-f trimmer C3 for maximum output.

ALIGNMENT

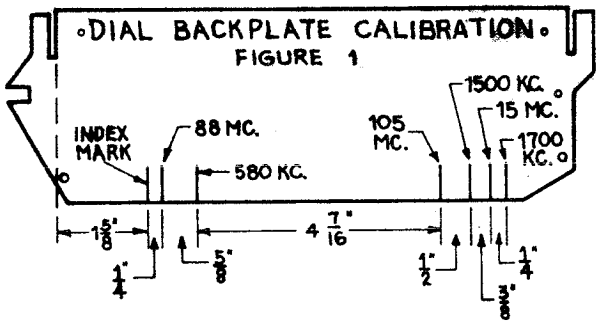
PHILCO 46-480

This chassis must be removed from the cabinet for aligning. Power should not be turned on in this receiver unless the speaker is connected. A-M alignment should be completed before F-M alignment. Alignment of the A-M circuits may not disturb the alignment of the F-M circuits. Calibrate the receiver dial backplate as shown in Figure 1. The receiver dial pointer should coincide with the index mark at the low frequency end of the dial when the gang condenser is fully in mesh.

A-M ALIGNMENT

Connect the output meter between terminals 3 (high) and 2 (ground) of the antenna terminal strip. The receiver loop should be connected between terminals 1 (high) and 2 (ground) of the antenna terminal strip. The signal generator should be connected to the standard Hazeltine loop Model 1150 and should be loosely coupled to the receiver loop. The volume control should be set at maximum and the tone control at maximum high. The generator output should always be just sufficient to obtain a minimum deflection on the output meter.

	Signal Generator Frequency	Receiver Band Switch Position	Receiver Dial Position	Adjust for Maximum
1.	455 kc.	Broadcast	Index Mark (condenser plates fully meshed)	C33 C29 C24 L16
2.	1700 kc.	Broadcast	1700 kc.	C17
3.	1500 kc.	Broadcast	1500 kc.	C16
4.	580 kc.	Broadcast	580 kc.	Adjust C23 for peak while rocking tuning control.
5.	1700 kc.	Broadcast	1700 kc.	Readjust C17
6.	15 mc.	Short Wave	15 mc.	Starting with trimmer C22 screw loosened, slowly tighten for peak on first signal heard. Image should be obtained with receiver tuned to 15.9 mc.
7.	15 mc.	Short Wave	15 mc.	C21



F-M Alignment

Connect a d-c vacuum tube voltmeter across the 5-mf condenser C43 in the ratio detector circuit. The alignment should be carried through without modulation of the generator output. The receiver band switch should be in the F-M position.

	Signal Generator Connection	Signal Generator Frequency	Receiver Dial Position	Adjust as Noted
1.	High side connected to projecting brass screw of L16 coil slug (first i-f transformer T1) through a .01 mf condenser.	9.1 mc.	Index mark (condenser plates fully meshed) Approximately 88 mc.	Fully tighten trimmer C32
2.	Same	9.1 mc.	Index Mark	Adjust for maximum C31 C30 C28 C26 C25
3.	Same	9.1 mc.	Index mark	Input should be adjusted for approximately 25 volts on dc meter. Loosen C32 slowly, recording the minimum and maximum readings. Set trimmer so that average of thexe voltage readings is obtained. Another metho' to obtain correct setting of C32 is to adjust this condenser so that the voltage across the 1200 mmf condenser in the T5 can (obtainable between the R18-R19 junction and chassis) is one-half the voltage obtained across the 5-mf condenser C43.
4.	Through a .01 mf condenser to the left rear terminal of the chassis FM female socket	105 mc.	105 mc.	Adjust for maximum C18 C20 C19

If a maximum voltage indication can not be obtained because either C18, C20, or C19 are completely screwed tight, it may be necessary to slightly compress manually the corresponding coils L3, L2, or L1. Similarly if maximum voltage indication is not obtained because C18, C20 or C19 are almost entirely screwed out, it will be necessary to slightly pull the turns apart of coils L3, L2 or L1. Then realign C18, C20 and C19 at 105 mc.

PHILCO RADIO & TELEV. CORP.

ALIGNMENT

PHILCO 46-1201

The receiver should be aligned with the chassis installed in the cabinet. Connect the output meter from the voice coil lug (green wire) on the speaker to ground. Disconnect the blue external antenna lead from ground. Connect the signal generator through a .01 mf condenser to the external antenna lead. Set the receiver volume control at maximum. The tuning condenser should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The signal generator output should at all times be just sufficient to obtain a minimum deflection on the output meter. Set the signal generator to 455 kc. and adjust the intermediate frequency amplifier transformer trimmers for maximum meter deflection in the following sequence: C10, C9, C8, C7. Set the generator and receiver to 1600 kc. and adjust the oscillator shunt trimmer C6 for maximum output. Set the generator and receiver to 1500 kc. and adjust the r-f trimmer C2 for maximum output.

ALIGNMENT

PHILCO 46-1209

Power should not be turned on in this receiver unless the speaker is connected. The chassis must be removed from the cabinet for alignment. Calibrate the receiver dial backplate as shown in **Fig. 1, Page 15-36** The receiver loop should be connected to terminals 1 (high) and 2 (low) of the antenna terminal strip. The output meter should be connected to terminals 3 (high) and 2 (low) of the antenna terminal strip.

	Signal Generator Frequency	Receiver Band Switch Position	Receiver Dial Position	Adjust for Maximum
1.	455 kc.	Broadcast	Index mark (condenser plates fully meshed)	C28 C26 C25 Coil slug of T1
2.	1700 kc.	Broadcast	1700 kc.	C6
3.	1500 kc.	Broadcast	1500 kc.	C1
4.	580 kc.	Broadcast	580 kc.	Adjust C8 for peak while rocking tuning control.
5.	1700 kc.	Broadcast	1700 kc.	Readjust C6
6.	15 mc.	Short Wave	15 mc.	Starting with trimmer C14 screw loosened, slowly tighten for peak on first signal heard. Image should be obtained with receiver tuned to 15.9 mc.
7.	15 mc.	Short Wave	15 mc.	C12

46-480 PUSH BUTTON ADJUSTMENT 46-1209

Note: Good reception of stations by use of push buttons depends on the accuracy of the manual tuning during the setting-up operation.

1. Allow the receiver to warm up for at least 20 minutes before setting up any stations.
2. The band switch must be in the push-button position.
3. Choose the most powerful local stations, those which are free from excess fading. Setting up weak or distant stations is not recommended.
4. List the desired stations, in order, from the low to the high frequencies. The station on your list that comes in nearest the left-hand end of the dial should be called station No. 1 and should be set up on button No. 1. Do not skip buttons but set up stations in numerical order.
5. Insert the proper station call tabs into the recesses of the respective buttons.
6. Manually tune in the desired station accurately.
7. Set the bandswitch to the push button position.
8. Push in the button to be set up to its depressed position.
9. Adjust its corresponding oscillator trimmer for the station signal which you tuned in manually above. Peak the adjustment for clearest reception.
10. Adjust its corresponding antenna trimmer for clearest reception.
11. Repeat the above procedure from step 6 to 10 for each button to be set up.

ALIGNMENT

PHILCO 46-1226

Power should not be turned on in this receiver unless the speaker is connected. The chassis should be removed from the cabinet and the dial backplate calibrated as shown in Figure 1. The receiver loop should be connected between terminals 1 (high) and 2 (low) of the antenna terminal strip. The signal generator is connected to the Hazeltine standard loop Model 1150 which is loosely coupled to the receiver loop. The output meter should be connected between terminal 1 (high) and 2 (low) of the antenna terminal strip. The tone control should be in the maximum high position. The volume control should be at maximum. The generator output should at all times be just sufficient to obtain a minimum deflection on the output meter.

	Signal Generator Frequency	Receiver Band Switch Position	Receiver Dial Position	Adjust for Maximum

PHILLIPS PAGE 15-1
MODELS 3-1A, 3-2A

MODELS 3-1A, 3-2A

PHILLIPS PETROLEUM CO.

Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B — connection (see voltage chart on opposite side for convenient B — location). Then reinstall chassis and loop in cabinet. The B — lead should extend from under the chassis at the back.

Connect ground lead of signal generator to B— lead.

Connect output meter across the speaker voice coil (terminals at back of speaker.)

Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.

Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.

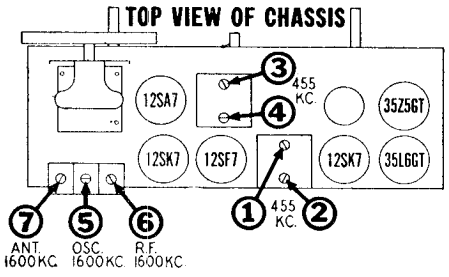

FIG. 2

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.

12SA7 1st DET.—OSC.
12SF7 I.F.—2nd DET.—A.V.C.
12SK7 1st A.F.
35L6GT OUTPUT

Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

ALIGNMENT PROCEDURE

1. The chassis and loop antenna should remain in their normal position in the cabinet throughout the following procedure.
2. Check arrangement of leads to push-button switch as shown in illustration on following page.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil.
5. Connect the ground lead of the signal generator to the receiver chassis.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.
7. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 KC Generator Signal	6	Broadcast R.F.	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 KC Generator Signal	7	Broadcast Antenna	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	600 KC	Broadcast (counter-clockwise)	Tune to 600 KC Generator Signal	8	Adjustable core of Broadcast Oscillator Coil.	Adjust for maximum output. Try to increase output by rotating core in and out and retuning receiver dial until maximum output is obtained.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	Repeat adjustments of trimmers 5, 6 and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	15 MC	Short wave	15 MC	9	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 14.1 MC. If image does not appear, realign at 15 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	15 MC	Short wave	Tune to 15 MC Generator Signal	10	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.5 MC	31 M (Clockwise)	9.5 MC	11	31 M Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 8.6 MC. If image does not appear, realign at 9.5 MC. with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.5 MC	31 M (Clockwise)	Tune to 9.5 MC Generator Signal	12	31 M Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

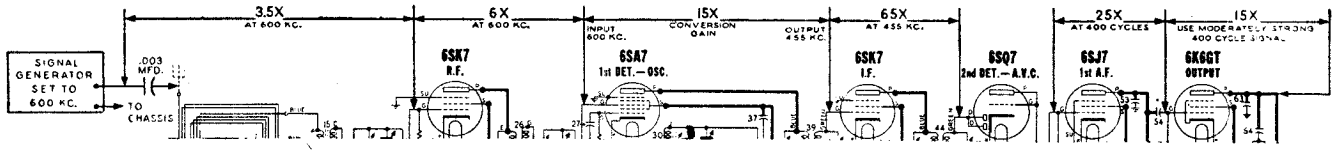
PHILLIPS PETROLEUM CO.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.

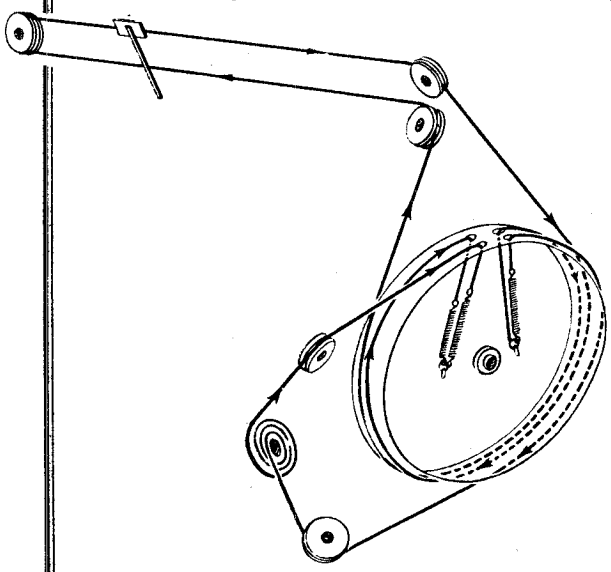


Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

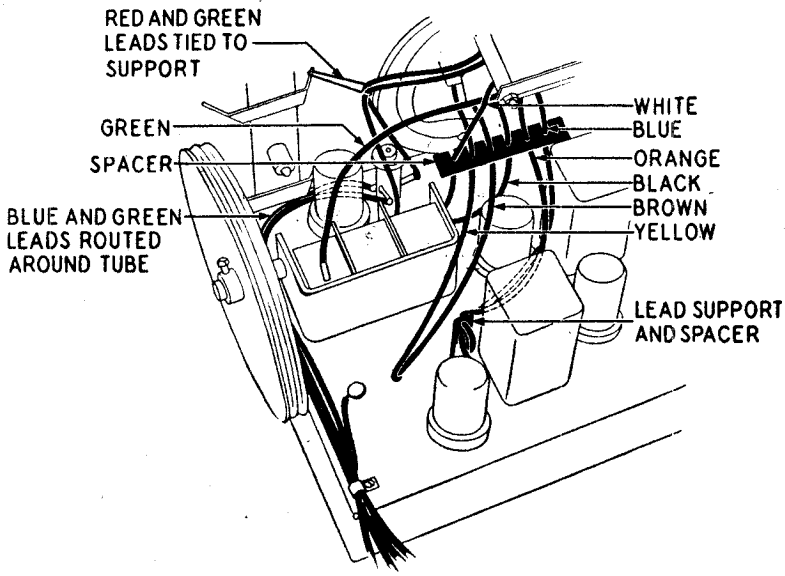
113177 Tension Spring
114955 Clip on end of cord
119087 Ring for dial cord
117057 Cord (102 inches)
Pointer drive 72 inches
Gang drive 30 inches



IMPORTANCE OF MAINTAINING FIXED POSITIONS FOR LEADS AT TOP OF CHASSIS

The wires shown in the above illustration are associated with tuned circuits which carry radio frequency currents. Therefore, care must be exercised to insure that they are properly routed and spaced. Anchoring and fixing spacing of wires minimizes freedom of movement and is utilized to maintain a stable arrangement.

Since the relative positions of these wires may affect tuned circuits it is important to avoid any change in arrangement after the receiver has been aligned. If the position of the wires has been disturbed, it is advisable to re-check alignment



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feedback circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

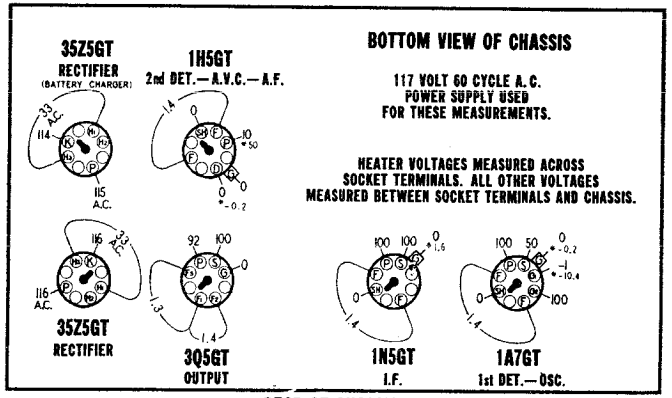
SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

VOLUME ON FULL WITH NO SIGNAL — DIAL TUNED TO 540 KC.

"AC-DC—BAT.—CHARGE" SWITCH IN "AC-DC" POSITION



REAR OF CHASSIS

*—Measured with vacuum tube voltmeter.

MODEL 3-4A

PHILLIPS PETROLEUM CO.

Slide chassis partially out of cabinet by removing staples at each side of wood shelf and pulling entire shelf back about 2 inches. Do not disturb connections to loop antenna.

Connect an output meter across the voice coil of the speaker or between the plate of the 3Q5GT output tube and chassis, through a .1 mfd. condenser.

Connect the ground lead of the signal generator to chassis through a .25 mfd. condenser.

Set the volume control in the maximum position and use a weak signal from the generator.

Set "AC-DC—BAT.—CHARGE" Switch in "AC-DC" position.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIG. GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

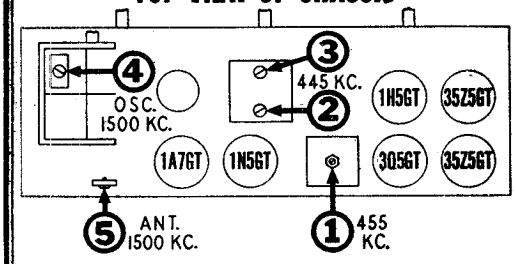
TOP VIEW OF CHASSIS



INDICATOR LAMP

The flashing neon lamp on the dial face indicates condition of batteries. This lamp is included in an oscillating (R-C) circuit which is designed to oscillate at approximately 3 pulses per second when batteries are in a fully charged condition. As the battery voltage decreases with use, number of pulses per second decreases.

This lamp will only show the true condition of the batteries when the Selector Switch is in the "Battery" position. Lamp flashes more rapidly during charging or "AC-DC" operation.

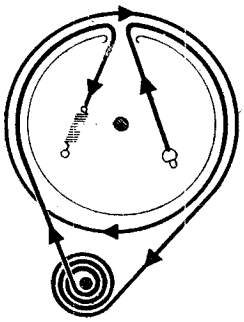
When battery voltage is low (approximately 72 volts) the lamp flashes more slowly (about once per second). The set should not be operated from battery power after this point is reached and batteries should be recharged immediately. Charge for at least twice the time they were used and as soon as possible after they are run down. As batteries age it is necessary to charge for a longer period. For longest battery life, charge immediately after using.

IMPORTANT:

1. Completely dead batteries cannot be recharged.
2. When set is connected to a DC line, check for correct polarity by operating it before attempting to charge the batteries.
3. Batteries will be discharged if ON-OFF switch is left ON when power cord is not connected to wall outlet.

CHARGING CIRCUIT

The battery charging circuit consists of a 35Z5GT rectifier and a suitable resistor voltage dividing network. This circuit provides a very low charging current when the receiver is operated on AC-DC and is just enough to maintain the batteries but will not charge them. A separate charging position is provided for the regular charging operation. A charging rate of approximately ⅓ the discharge rate is used to give best results.



DIAL DRIVE CORD ARRANGEMENT

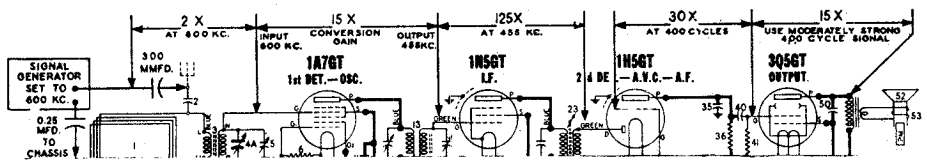
To string dial cord, set gang condenser to fully meshed position and use following parts:

114955	Clip on end of cord
117057	Cord (28 inches)
119087	Ring for dial cord
161384	Tension Spring

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements.

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes).
2. For R.F. and I.F. measurements connect negative terminal of a 1½-volt battery to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning).
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 1½ volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

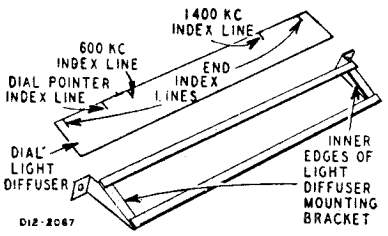
DIAL CALIBRATION

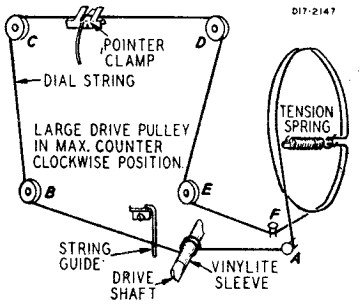


In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two extreme index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, turn the large drive pulley to the maximum clockwise position. The dial pointer should be directly over the dial pointer index line. (See illustration).

TUNING ASSEMBLY SERVICE

Exacting requirements in the tuning assembly make it impractical to replace the drive cord, coils and components in this assembly other than the trimmer condensers. Should the drive cord break, or components other than the trimmer condensers require service, the entire assembly must be ordered and replaced as a unit.



DRIVE CORD REPLACEMENT

Turn the large drive pulley to the maximum counterclockwise position. Use a new 53 inch drive cord, tie one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind two turns clockwise around the tuning shaft with the turns progressing away from the chassis. After string is installed, stretch the tension spring and tie free end of cord to spring. Cut off excess string.

NOTICE: There is a power rating label on the chassis. This label specifies the power supply on which the radio may be used, and identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

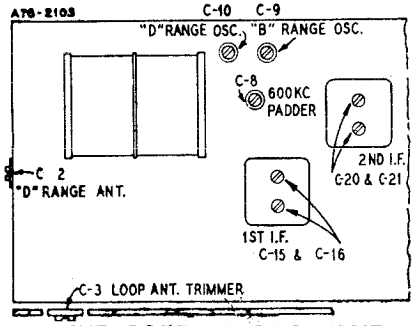
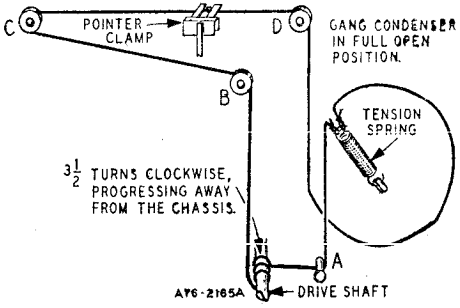
SPECIFICATIONS

Speaker.....6" PM Dynamic
Intermediate Frequency.....455 KC
Selectivity.....40 KC Broad at 1000 Times Signal
Sensitivity (For 0.5 Watt Output, with External Antenna)
B Range..... 9 Microvolts Av.
D Range.....20 Microvolts Av.
Power Consumption (at 117 Volts AC) .....40 Watts (normal)
Power Output.....4 Watts Maximum
2.3 Watts, 10% Harmonics
Tuning Frequency Range
B Range.....540-1600 Kilocycles
D Range.....9-15.5 Megacycles



DRIVE CORD REPLACEMENT

The drive cord may be replaced as shown in the accompanying illustration. For this purpose use a 58" piece of cord. After installing the cord, stretch the tension spring before fastening the free end of the string.



ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output indicating Meter—Non Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C20) & (C21 1st. I.F. (C15) & (C16
RANGE B	1620 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B(C9)
	1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output. Set Pointer to 1400 KC (See Note A)	Ant. Range B (C3)
	600 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Oscillator (C8) Rock Rotor—See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement of output.					
RANGE D	15,600 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	14,000 KC	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Ant. Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet.					
	1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B(C3)

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn Rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

REPLACEMENT PARTS LIST

NOTICE: There is a power rating label on the chassis. This label specifies the power supply on which the radio may be used, and identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

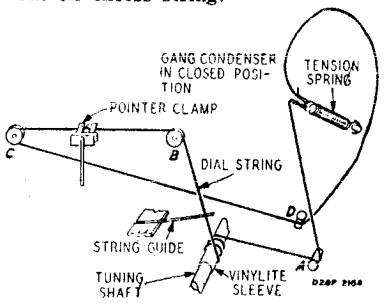
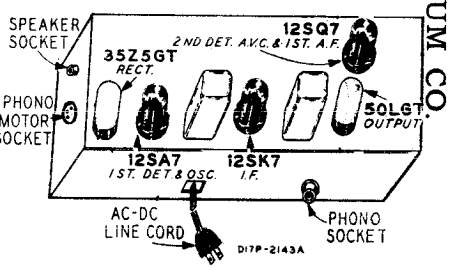
DRIVE CORD REPLACEMENT

Turn the large drive pulley to the maximum counterclockwise position. Use a new 57 inch drive cord, tie one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2¾ turns counterclockwise around the tuning shaft with the turns progressing away from the chassis. After string is installed, stretch the tension spring and tie free end of cord to spring. Cut off excess string.





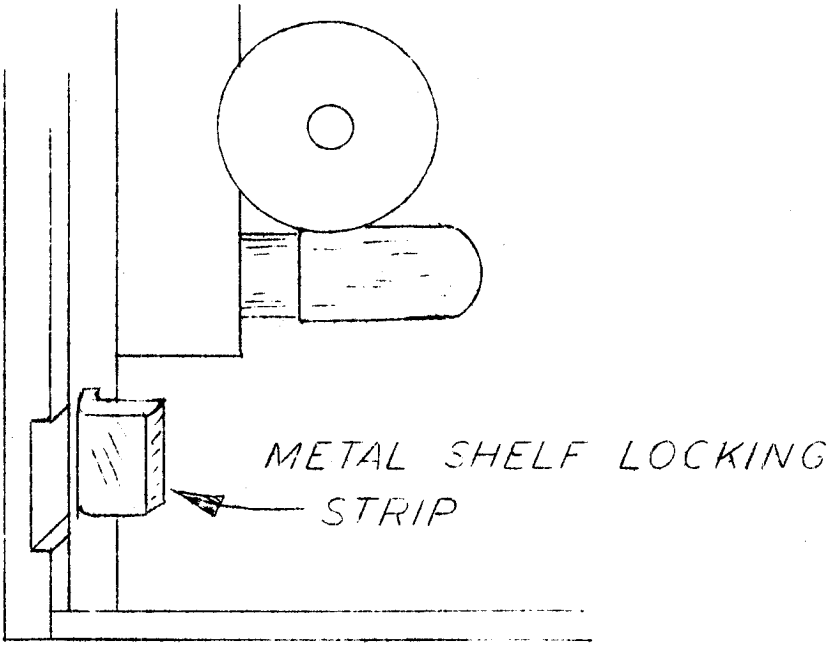
PHILLIPS PETROLEUM CO.
MODEL 3-29A

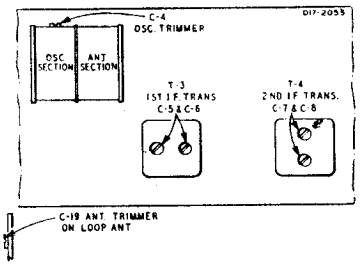
MODEL 3-29A

PHILLIPS PETROLEUM CO.

REMOVAL OF RADIO CHASSIS

To remove the radio chassis for servicing, pull off the three control knobs, disconnect the cables and wires leading to the loud speaker, built-in antenna, etc., then withdraw the metal shelf locking strip from near the lower corner of the chassis. Swing the bottom of the chassis and the mounting shelf out from the cabinet until the top of the shelf is disengaged. The unit may then be withdrawn from the cabinet.





ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter: Non-Metallic Screwdriver.

The screws for adjusting both the R.F. and I.F. amplifiers of this receiver, together with the frequencies at which they should be adjusted, are pictured in the diagram. Before aligning the I.F. amplifier, the generator must be connected to the grid of the 12SK7 R.F. tube through a .1 mfd. condenser. Before aligning the short wave band, connect the signal generator to the "OUTSIDE ANTENNA" post through a 400 ohm resistor.

To align the "LOOP" antenna the receiver should be in the cabinet with the back in place and the Antenna Selector Switch set for "LOOP". Through the slot in the lower left-hand side of the cabinet back adjust the trimmer on the extreme left for maximum signal strength at about 1400 kc. Then set the Antenna Selector Switch for "OUTSIDE ANTENNA" and adjust the trimmer located next to the switch for maximum signal strength at 1400 kc.

Broadcast Band—535 to 1720 kc.

Short Wave Band—5.6 to 24.0 mc.

BATTERY INSTALLATION

Remove the screws from the back and carefully lift off the back.

When removing the batteries, first unscrew clamps, and then remove battery plugs. Be sure not to pull on the cables, but on the plugs themselves.

Place the new "A" and "B" batteries in position shown on diagram below and replace clamps in position shown below.

The blue and white cable, coming from the chassis, has two 2-prong plugs which are then plugged into the "A" batteries. The red and black cable has two 3-prong plugs, both of which are plugged into the "B" batteries. The I.F. amplifier may be aligned with the chassis out of the cabinet but with the loop antenna plugged in. For the I.F. alignment the signal generator must be connected to the grid of the 1A7GT tube through the .1 mfd. condenser. The R.F. trimmers should also be peaked for maximum with the chassis out of the cabinet. When aligning the ANT. trimmers, the "A" and "B" batteries must be in place, the loop antenna and receiver correctly mounted in the cabinet. The receiver may be aligned on either batteries or house current. When the receiver is aligned on the broadcast band, connect the signal generator to the ANT. post at the back through a .0002 mfd. condenser, and on the shortwave band use a 400 ohm carbon resistor.

OPERATION OF PUSHBUTTONS

Four pushbuttons are provided. These pushbuttons operate in pairs, the left two control the choice of either battery or AC-DC power supply. The right two select either the Shortwave or the Broadcast band, as desired.

For example, when it is desired to operate the Broadcast band from house current, plug the electric cord into the light socket. Rotate the left-hand knob approximately half way to the right and push the button marked A.C.-D.C, and the button marked B.C. If after a period of one minute the dial light does not light or the electric hum is too apparent, reverse the plug in the light socket. WHEN OPERATING THIS RECEIVER FROM THE HOUSE CURRENT BE ABSOLUTELY SURE THAT THE DIAL LIGHT IS LIT AND THAT THE A.C.-D.C. PUSHBUTTON IS PUSHED.

To turn off the receiver it is only necessary to turn the left-hand knob to the left until the red indicator disappears, regardless of the position of the buttons.

In order to light the pilot light for the dial ON BATTERY OPERATION, the switch button on the lower left-hand ledge inside the front door must be pressed down. When the button is released the light is switched off automatically to save the batteries.

Broadcast Band: 187 to 561 meters; or 535 to 1605 kc.

Short Wave Band: 5.63 to 16.56 mc.; or 18.2 to 53.2 meters

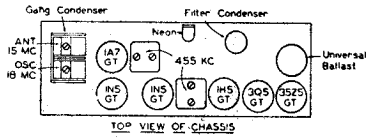
Broadcast Band 535 to 1720 Kc
Short Wave Band 5.7 to 18.7 Mc

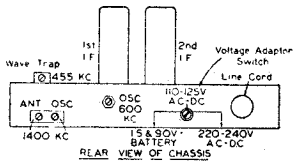
In case battery packs, as listed below, are unavailable, separate batteries may be used by cutting off the plug and connecting the leads as follows:

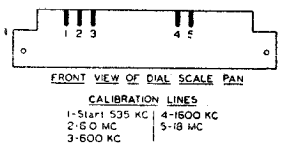
White	1.5 volts	+
Black	1.5 volts	-
Red	90 volts	+
Green	90 volts	-

Battery packs that may be used:

Eveready	#748
Ray-O-Vac	#AB-82
Burgess	#17GD60
Bond	#0528







A battery beacon is provided to serve as a combination "ON" "OFF" and battery life indicator.

The battery beacon will flicker approximately once each second when the batteries are new. With the aging of the batteries, the rate of flickering and the brilliancy will be reduced

End of useful battery life will occur when the battery beacon ceases to operate. Short period operation may be secured if the batteries are permitted long periods of rest after the end of the useful life occurs.

The location of all adjustments used in re-aligning this receiver, and the frequencies at which these adjustments should be made are shown in the accompanying diagram.

When aligning the I. F. amplifier, the generator must be connected to the grid of the 1A7GT tube through a .1 mfd condenser. When aligning the receiver on the Broadcast Band, connect the generator to the Antenna wire through a .0002 mfd condenser, and on the short wave band through a 400 ohm carbon resistor.

Alignment should be attempted only if a low range A.C. meter, a signal generator, and insulated alignment tools are at your disposal. The A.C. meter is used as an output meter. The signal generator must cover a frequency range from 450 kc to 24 mc.

It is essential that the signal generator be connected to the points indicated in the alignment chart through the proper dummy antenna.

A good ground connection, secured between the groundpost of the signal generator and the chassis, is necessary.

The output of the signal generator must always be kept at its lowest possible value. This is to prevent the automatic volume control of the receiver from interfering with accurate alignment.

During alignment, the line voltage feeding the receiver power supply should be kept at approximately 117 volts.

The locations of adjustment screws are indicated clearly on the schematic diagram. Alignment adjustments should be made only in the sequence given in the chart.

For all alignments, connect the outputmeter across the voice coil. With the volume control turned fully clockwise, tune for a maximum reading.

PORTO-SERVER INC.

Remove chassis and loop from cabinet. Reconnect both leads to loop and space it approximately same distance from chassis as when installed in cabinet.

With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.

Connect an output meter across the speaker voice coil or from the plate of the 50L6GT tube to chassis through a .1 Mfd. condenser.

Connect the ground lead of the signal generator to the receiver chassis through a .25 Mfd. condenser.

Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

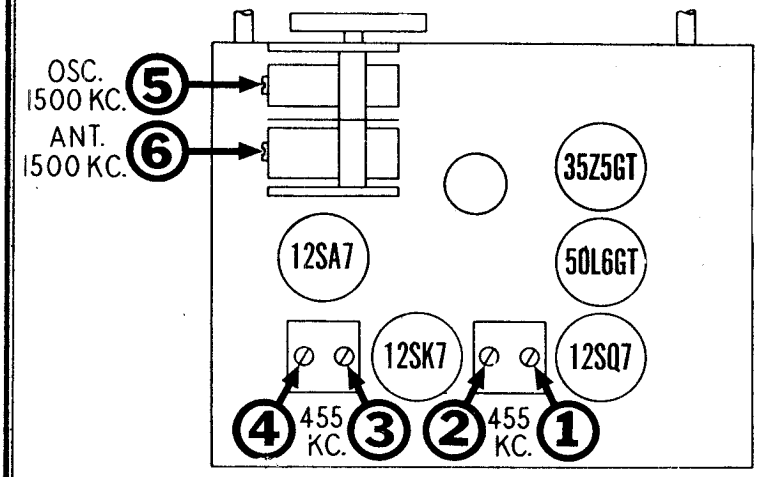
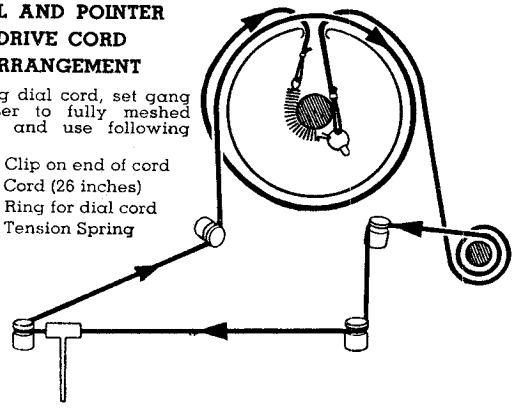
200 MMFD. Mica Condenser	External antenna lead on loop.	1500 KC	Tune to 1500 KC generator signal.	6	Broadcast Antenna	Adjust for maximum output.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

114955 Clip on end of cord
117057 Cord (26 inches)
119087 Ring for dial cord
161284 Tension Spring

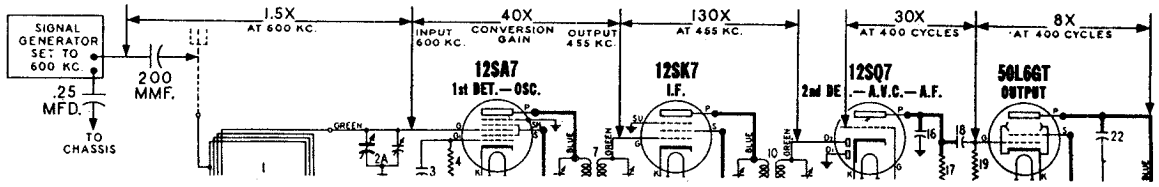


APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC signal with 400 cycles modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3-volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

PORTO-SERVER INC.

ALIGNMENT PROCEDURE

1. Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location). Then reinstall chassis and loop in cabinet. The B— lead should extend from under the chassis at the back.
2. Connect ground lead of signal generator to B— lead.
3. Connect output meter across the speaker voice coil (terminals at back of speaker.)
4. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.						
.1 MFD. Condenser	Ungrounded terminal of trimmer No. 6 (see Fig. 2 below for location of trimmer.)	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.

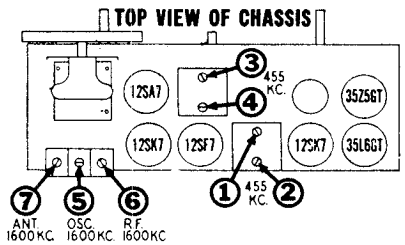

FIG. 2

AUDIO OSCILLATION

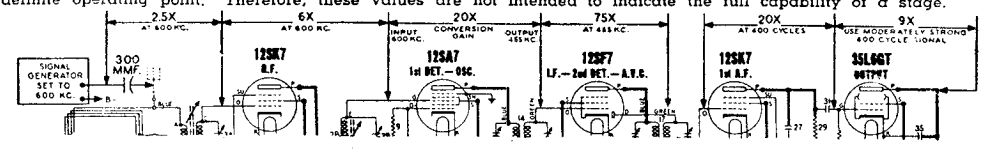
The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

MODEL 5A65WG-503

PURE OIL CORP.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter: Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)

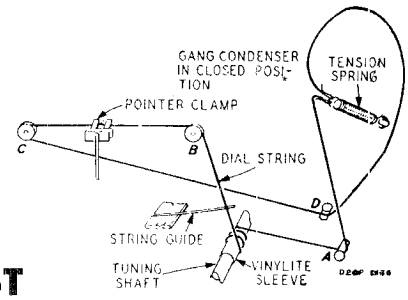
1400 KC	External Antenna Clip on Loop	Chassis	50 mmf.	Turn Dial to 1400 KC	Antenna (C-19)

DRIVE CORD REPLACEMENT

Turn the large drive pulley to the maximum counterclockwise position. Use a new 57 inch drive cord, tie one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2¾ turns counterclockwise around the tuning shaft with the turns progressing away from the chassis. After string is installed, stretch the tension spring and tie free end of cord to spring. Cut off excess string.



REPLACEMENT PARTS LIST

NOTICE: There is a power rating label on the chassis. This label specifies the power supply on which the radio may be used, and identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

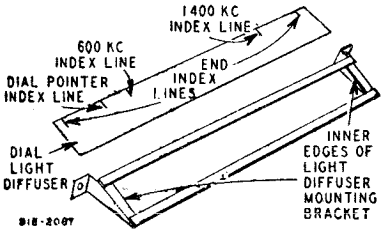
Note A—Set dial pointer to 1400 KC Index line on dial light diffuser.

DIAL CALIBRATION



In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two extreme index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped to prevent movement of the diffuser strip. To position the dial pointer, turn the large drive pulley to the maximum counterclockwise position. The dial pointer should be directly over the dial pointer index line. (See illustration).

ALIGNMENT PROCEDURE

Check dial pointer position, see DIAL CALIBRATION paragraph.

Volume Control—Maximum. All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter: Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.

ALIGNMENT PROCEDURE

Check dial pointer position, see DIAL CALIBRATION paragraph.
Volume Control—Maximum All Adjustments.
Allow Chassis and Signal Generator to "Heat Up" for several Minutes
The equipment in column at right is required for alianing:

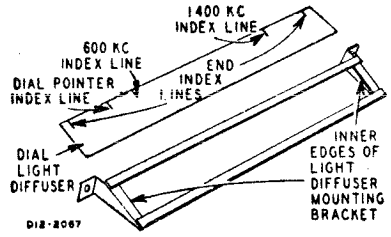
Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter: Non-Metallic Screwdriver.

Dummy Antennas—.1mf., 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	TUNER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
455 KC	Control Grid 12SK7—I.F.	Point "X" 12SK7—I.F. Prong No. 3	.1 mf.	Turn Drive Pulley to Counterclockwise Position	2nd I.F. (C7) & (C8)
455 KC	Control Grid 12SA7—1st Det.	Same As Above	.1 mf.	Turn Drive Pulley to Counterclockwise Position	1st I.F. (C5) & (C6)
1610 KC	Control Grid 12SA7—1st Det.	Same As Above	.1 mf.	Turn Drive Pulley to Maximum Counterclockwise Position	Oscillator (C4)
1610 KC	External Antenna Clip On Loop	Chassis	50 mmf.	Turn Drive Pulley to Maximum Counterclockwise Position	Antenna (C-2)

DIAL CALIBRATION



In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

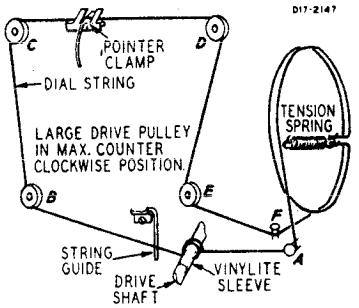
Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two extreme index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, turn the large drive pulley to the maximum clockwise position. The dial pointer should be directly over the dial pointer index line. (See illustration).

DRIVE CORD REPLACEMENT

Turn the large drive pulley to the maximum counterclockwise position. Use a new 53 inch drive cord, tie one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind two turns clockwise around the tuning shaft with the turns progressing away from the chassis. After string is installed, stretch the tension spring and tie free end of cord to spring. Cut off excess string.

TUNING ASSEMBLY SERVICE

Exacting requirements in the tuning assembly make it impractical to replace the drive cord, coils and components in this assembly other than the trimmer condensers. Should the drive cord break, or components other than the trimmer condensers require service, the entire assembly must be ordered and replaced as a unit.



Selectivity	59 KC Broad at 1000 Times Signal
Intermediate Frequency	455 KC
Speaker	5" PM Dynamic
Sensitivity (for .05 watt output)	560 microvolts per meter average

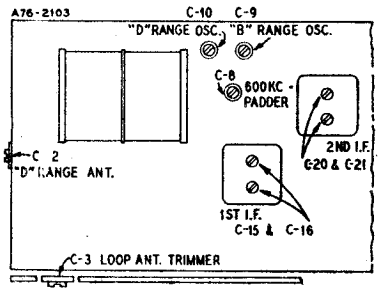
SPECIFICATIONS

Speaker.....6" PM Dynamic
Intermediate Frequency.....455 KC
Selectivity.....40 KC Broad at 1000 Times Signal
Sensitivity (For 0.5 Watt Output, with External Antenna)
B Range..... 9 Microvolts Av.
D Range.....20 Microvolts Av.
Power Consumption (at 117 Volts AC) .....40 Watts (normal)
Power Output.....4 Watts Maximum
2.3 Watts, 10% Harmonics
Tuning Frequency Range
B Range.....540-1600 Kilocycles
D Range.....9-15.5 Megacycles



ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output indicating Meter—Non Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

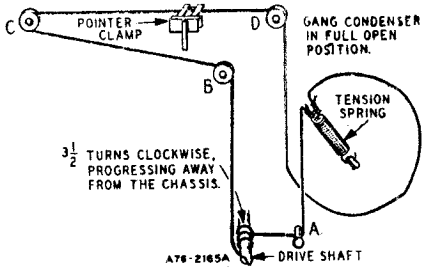
	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C20) & (C21) 1st. I.F. (C15) & (C16)
RANGE B	1620 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B(C9)
	1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output Set Pointer to 1400 KC (See Note A)	Ant. Range B (C3)
	600 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Oscillator (C8) Rock Rotor—See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement of output.					
RANGE D	15,600 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	14,000 KC	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Ant. Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B(C3)

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn Rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

DRIVE CORD REPLACEMENT

The drive cord may be replaced as shown in the accompanying illustration. For this purpose use a 58" piece of cord. After installing the cord, stretch the tension spring before fastening the free end of the string.



REPLACEMENT PARTS LIST

NOTICE: There is a power rating label on the chassis. This label specifies the power supply on which the radio may be used, and identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

DIAL AND POINTER DRIVE CORD ARRANGEMENT

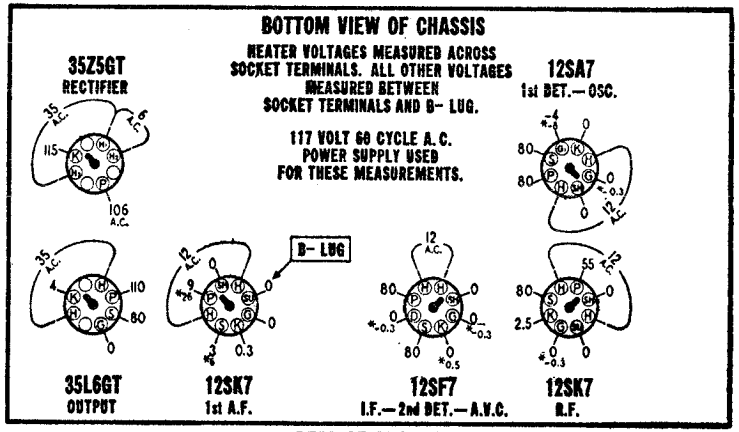
To string dial cord, turn the main drive drum to maximum counter - clockwise position and use following parts:

114955 Clip on end of cord
117057 Cord (55 inches)
119087 Ring for dial cord
161384 Tension Spring

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

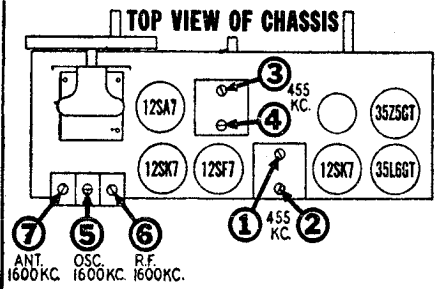
VOLUME ON FULL WITH NO SIGNAL **DIAL TUNED TO 540 KC.**



REAR OF CHASSIS

*—Measured with vacuum tube voltmeter

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.						
.1 MFD. Condenser	Ungrounded terminal of trimmer No. 6 (see Fig. 2 below for location of trimmer.)	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	1600 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
				7	Broadcast Antenna	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1400 KC	Tune to 1400 KC generator signal	Ant. coil tuning slug		Adjust position of slug for maximum output.
				R.F. coil tuning slug		Adjust position of slug for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Recheck adjustment for maximum output.
				7	Broadcast Antenna	Recheck adjustment for maximum output.
Apply a coating of speaker cement at top of each tuning core stem to prevent movement.						



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

1. Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side of convenient B— location). Then reinstall chassis and loop in cabinet. The B— lead should extend from under the chassis at the back.
2. Connect ground lead of signal generator to B— lead.
3. Connect output meter across the speaker voice coil (terminals at back of speaker.)
4. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

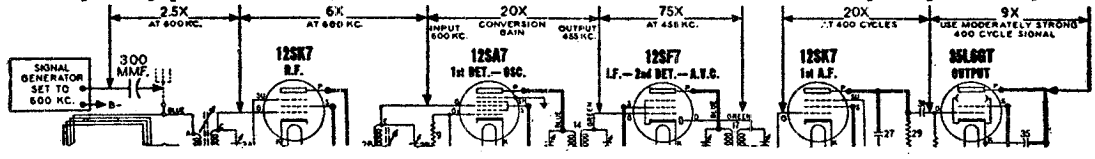
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point.
   IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feedback circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

113177 Tension Spring
114955 Clip on end of cord
119087 Ring for dial cord
117057 Cord (102 inches)

Pointer drive 72 inches
Gang drive 30 inches

Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagram.

MODEL 508

PURE OIL CORP.

1. The chassis and loop antenna should remain in their normal position in the cabinet throughout the following procedure.
2. Check arrangement of leads to push-button switch as shown in illustration on following page.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil.
5. Connect the ground lead of the signal generator to the receiver chassis.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.
7. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 KC Generator Signal	6	Broadcast R.F.	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 KC Generator Signal	7	Broadcast Antenna	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	600 KC	Broadcast (counter-clockwise)	Tune to 600 KC Generator Signal	8	Adjustable core of Broadcast Oscillator Coil.	Adjust for maximum output. Try to increase output by rotating core in and out and retuning receiver dial until maximum output is obtained.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	Repeat adjustments of trimmers 5, 6 and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	15 MC	Short wave	15 MC	9	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 14.1 MC. If image does not appear, realign at 15 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	15 MC	Short wave	Tune to 15 MC Generator Signal	10	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.5 MC	31 M (Clockwise)	9.5 MC	11	31 M Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 8.6 MC. If image does not appear, realign at 9.5 MC. with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.5 MC	31 M (Clockwise)	Tune to 9.5 MC Generator Signal	12	31 M Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

RCA MFG. CO.

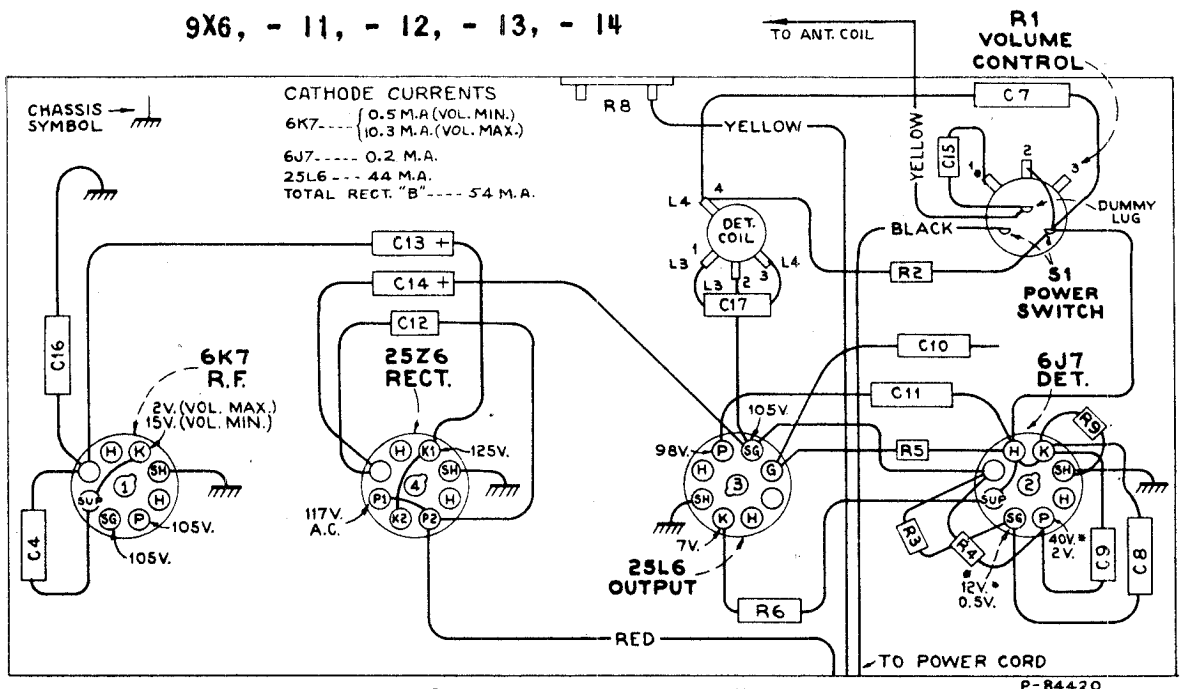
Schematic Circuit Diagram

9X6, - 11, - 12, - 13, - 14



BOTTOM VIEW - REAR OF CHASSIS

R-F Wiring Diagram and Socket Voltages

* Note: Values with (*) are operating voltages. Values not starred are actual measured voltages.

Measurements made to common negative line, unless otherwise specified.

Measurements made with set tuned to quiet point, volume control at minimum, using 1,000-ohm-per-volt meter, having ranges of 10, 50, and 250 volts. (Use nearest range above the specified measured voltage.)

Values should hold within approximately ± 20% for 117-volt 60-cycle a-c supply. On d-c, voltages are approximately 10% lower, except heaters, which remain the same.

Precautionary Lead Dress

1. Dress green lead from antenna coil to gang up from speaker chassis.
2. Green lead from gang to grid of 6J7 must be dressed down and away from top of bracket, and centered in gang section.
3. Green lead from detector coil to gang must be dressed under pilot lamp bracket: Any excess wire should be pulled through to under side of chassis.
4. Pilot lamp leads must be dressed clear of gang rotor.
5. Magnetite core in detector coil must not be in contact with base or mounting screw.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Antenna.—The set is equipped with a 25-foot antenna. Do not connect the antenna to ground. If an outdoor antenna is used, it should not be longer than 100 feet, including lead-in. If it is longer, connect a 100 to 200 mmfd. capacitor in series with the lead-in.

25-Cycle Operation

For 25-cycle operation, connect a 16 mfd., 150-volt dry electrolytic capacitor (Stock No. 31323) in parallel to C13.

POWER SUPPLY RATINGS

A-C Rating ..... 105-125 volts, 50-60 cycles, 50 watts
D-C Rating ..... 105-125 volts, 50 watts

POWER OUTPUT (125-volt, 60-cycle supply)

Undistorted ..... 1.0 watt
Maximum ..... 1.5 watts

LOUDSPEAKER

Type ..... 3-inch Electrodynamic
Voice-Coil Impedance ..... 3 ohms at 400 cycles

Alignment Procedure

Reel up the antenna wire, and keep it away from chassis during alignment. Connect the high side of test-oscillator through an 80 mmfd. capacitor to the antenna terminal. Connect low side of oscillator to receiver chassis through a 0.1 mfd. capacitor. Turn gang condenser to minimum (full out), tune oscillator to 1,760 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscillator.

Pre-setting Dial.—With gang condenser rotor plates turned full in for maximum capacity, loosen dial-drum set screw, and turn drum so that the top edge of dial (low-frequency end) is approximately 1/16-in. below level of gang frame, and tighten set-screw.

	SPEAKER ASSEMBLIES (86309-2)
31325	Cone—Speaker cone and voice coil (L5)
32025	Speaker complete
	MISCELLANEOUS ASSEMBLIES
31326	Escutcheon—Station selector dial escutcheon—Model 9X6
31915	Escutcheon—Station selector dial escutcheon—Models 9X11, 9X12, 9X13 and 9X14 only
31914	Knob—Station selector or volume control knob—Models 9X12 and 9X13 only
31204	Knob—Station selector or volume control knob—Models 9X6, 9X11 and 9X14 only
30900	Spring—Retaining spring for knobs

Adjustments for Push-Button Tuning MODEL X-55

The push-buttons should be adjusted for six favorite stations after the receiver has been operating for a brief warm-up period. Each button may be set up to any standard broadcast station. The preferable arrangement is to adjust for stations in the order of frequency, from low to high. Proceed as follows:

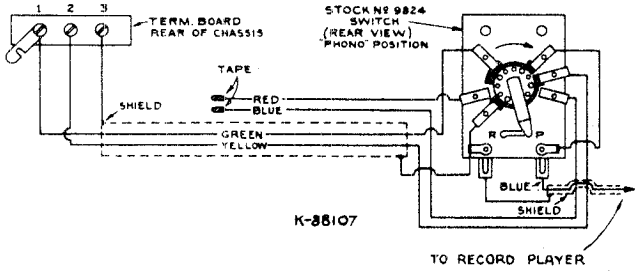
1. Pull off the push-buttons and loosen the push-button rods with a small screwdriver.

2. Turn the accessory switch to "Radio" position and accurately tune in the station for which the first button is to be set.

3. Press in push-button rod No. 1 (left) with the screwdriver, as far as it will go without undue pressure, hold in, retune station with manual control if necessary for best reception, and then carefully tighten up the rod. Do not tighten more than ¼ turn after the rod begins to grip or damage to the mechanism may result.

4. Replace the push-button on its shaft.

5. Proceed in a similar manner for the remainder of the push-buttons.



Record Player Connections, Using a No. 9824 Switch

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLY (RC-473A)
33719	Belt—Push button arm adjustment belt and rivets

MODELS Q10, Q10A, Ch. RC-594C Early
MODELS Q10, Q10A, Q10-2, Q10A-2, Ch. RC-594C, Late

Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown in the schematic drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

FOR EARLY MODELS

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator through a .01 mfd. capacitor to the receiver chassis, and keep the oscillator output low to avoid a-v-c action.

FOR LATE MODELS

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and mounted above the pointer for reference during alignment. The extreme left hand mark of the Standard Broadcast scale must be in line with the left hand mark on the dial backing plate.

Dial Backing Plate.—In the event that only the chassis is returned for service, the marks on the dial backing plate may be used during alignment; refer to the Dial Indicator and Drive Mechanism drawing for corresponding frequencies.

Dial Pointer.—With the gang condenser in full mesh the dial pointer should be set to the left hand reference mark on the dial backing plate.

Steps	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust following for max. output—
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	B. C.; 1600 kc quiet point	L11-L10 (2nd I-F Trans.)
2	Stator of gang cond. C2 through 0.1 mfd.			L9-L8* (1st I-F Trans.)
3	Antenna lead through 300 ohm resistor	18.2 mc	S. W.; gang condenser open	C6 (osc.)**
4		15.2 mc	S. W.; maximum signal rock gang	C3 (ant.)***
5	Antenna lead through 200 mmf. capacitor	600 kc	B. C.; 600 kc (2nd mark from left)	L7 (osc.)
6		1300 kc	B. C.; rock gang at 1300 kc†	C7 (osc.)
7		600 kc	B. C.; rock gang at 600 kc	L7 (osc.)
8	Repeat steps 6 and 7			

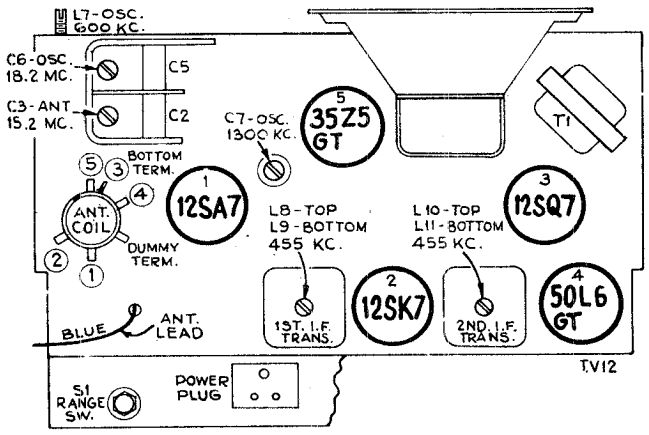
† 1300 kc corresponds to a point ½ inch to the left of the right hand mark on the dial backing plate.

* Do not readjust L10 or L11 when test oscillator is connected to C2.

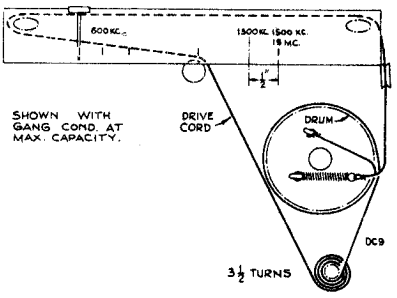
** Use minimum capacity peak if two peaks can be obtained.

*** Image signal of lesser amplitude should occur at 14.3 mc.

NOTE.—Oscillator tracks above signals on both bands.



Tube and Trimmer Locations



Dial Indicator and Drive Mechanism

Frequency Ranges

Standard Broadcast ("A" Band) ..... 540-1,680 kc (555-178 m)
Short Wave ("C" Band) ..... 4.7-18.2 mc (63.8-16.5 m)

Intermediate Frequency ..... 455 kc

RCA Tube Complement

(1) RCA-12SA7 ..... 1st Detector-Oscillator
(2) RCA-12SK7 ..... I-F Amplifier
(3) RCA-12SQ7 ..... 2nd Detector, A.V.C., and A-F Amplifier
(4) RCA-50L6GT/G ..... Power Output
(5) RCA-35Z5GT/G ..... Rectifier

Power Supply Ratings (D-C or 40 to 100 cycles A-C)

Q10 .....105-125 volts..... 30 watts
Q10A .....210-250 volts..... 60 watts

Q10, Q10-2 .....105-125 volts..... 30 watts
Q10A, Q10A-2 .....210-250 volts..... 60 watts

Power Output Rating

Undistorted ..... 1.25 watts
Maximum ..... 3.1 watts

Loudspeaker (92510-2)

Type ..... 5-inch Round Permanent-Magnet Dynamic
Voice Coil Impedance ..... 4 ohms at 400 cycles

Tuning Drive Ratio ..... 18 to 1

PRECAUTIONARY LEAD DRESS

1. Dress output plate capacitor and output transformer leads down next to chassis.
2. Dress 12SQ7 grid resistor down next to chassis, and away from power ground wire to switch.
3. Dress lead from 2nd I-F transformer to volume control down to chassis and away from adjacent parts.
4. Keep grid end of R1 as short as possible.
5. Keep body of C1A slightly away from chassis.

POWER SUPPLY POLARITY.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

CAUTION.—Repair of the power cord furnished with Model Q10A should not be attempted; apply to your RCA Distributor for a replacement.

RCA MFG. CO.

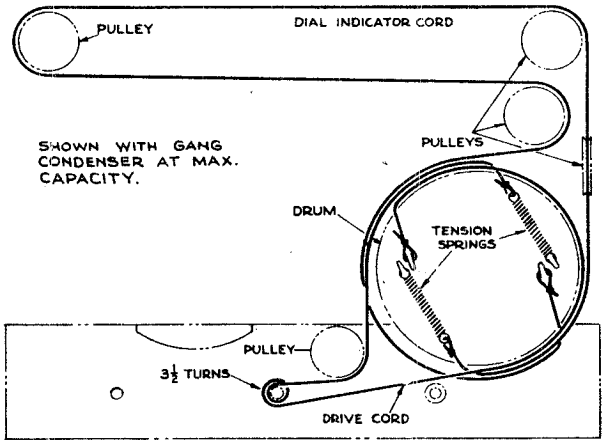
Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown in the diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the indicator-drive-cord drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees.

As the first step in r-f alignment, check the position of the drum. The "180°" mark on the drum scale must be vertical and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.



Victrola Attachment.

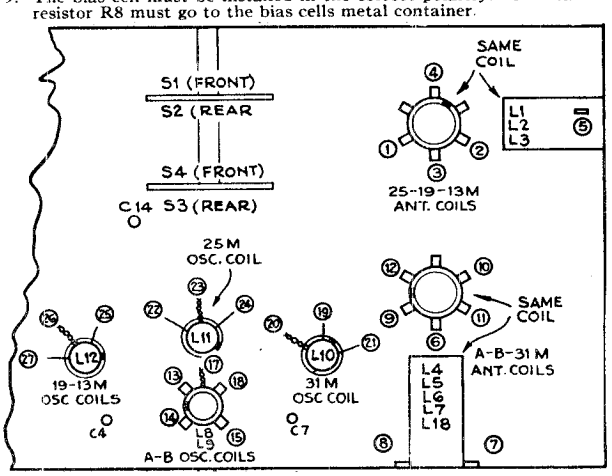
The cable from the Victrola attachment should be terminated with a Stock No. 31048 plug.

When Victrola attachment is in use, the volume control on the radio should be at minimum, and, if necessary, tune set off frequency from any very strong station.

When Victrola attachment is not in use its plug should be disconnected.

Precautionary Lead Dress.

1. Twist yellow lead from terminal 14 of L8 to terminal 6 of S3 with the lead from terminal 27 of L12 to terminal 5 of S4.
2. All other oscillator coil leads must be kept apart from each other as well as from other leads and parts. No two leads may be less than ⅛ inch apart.
3. The lead from the tap on 19-13 oscillator coil to pin number 6 of 6SA7 socket should be dressed up and away from all parts as far as possible.
4. Condensers C8, C9 and C16 must be as far away from all metal parts as possible.
5. All leads from the antenna coil to the range switch should be dressed together.
6. The green lead from pin 4 of 6SA7 socket to pin 4 of the 6S7 socket should be dressed down against the chassis and away from the I. F. terminals.
7. AVC by-pass condenser C19 and the lead from pin number 7 of the 6T7G socket must clear the tuning flywheel by at least ⅛ inch.
8. The leads to the power switch should be twisted and dressed up and away from the bias cell.
9. The bias cell must be installed in the correct polarity. The lead from resistor R8 must go to the bias cells metal container.



Coil and Band Switch Locations (Bottom Chassis View)

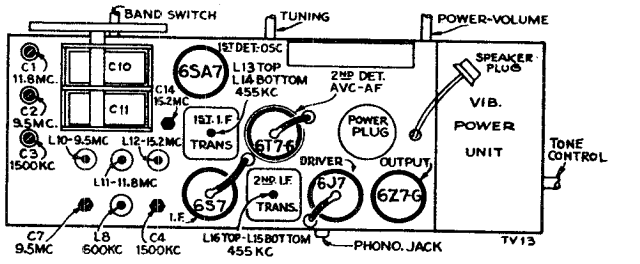
Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Range switch	Turn radio dial to—	Adjust the following for max. peak output
1	I-F grid cap, in series with .01 mfd.	455 kc	A	Quiet point near 180°	L16—L15 2nd I-F transformer
2	1st Det. grid, in series with .01 mfd.				L14—L13 1st I-F transformer
3	Ant. lead in series with 300 ohms	11.8 mc	25M	138.5°	L11 (osc.)* C1 (ant.)
4		15.2 mc		17°	C14 (osc.)***
5		Repeat steps 3 and 4.			
6		15.2 mc	19-13M	156°	L12 (osc)*
7		9.5 mc	31M	156°	L10 (osc.)* C2 (ant.)
8		9.5 mc	B	11.5°	C7 (osc.)**
9	Ant. lead in series with 200 mmf.	1,500 kc	A	26°	C4 (osc.)** C3 (ant.)
10		600 kc		150°	L8 (osc.)* (Rock gang.)
11	Repeat steps 9 and 10.				

*If two peaks can be obtained, use the one obtained when the core screw is farthest out (counter-clockwise).

**Use minimum capacity peak if two can be obtained.

***Use minimum capacity peak if two can be obtained. Check image to determine that C14 has been adjusted to the correct peak by tuning receiver to approximately 14.29 mc (29°) where a weaker signal should be received.

NOTE: Oscillator tracks above signal on all bands.



Tube and Trimmer Locations (Top Chassis View)

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

Receiver Dial with Calibration Scale.—To determine the corresponding frequency for any setting of the calibration scales, refer to the dial with calibration scale drawing.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 540 kc mark, and gang condenser fully meshed. The indicator has a clip for attachment to the cable.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by adjusting the oscillator coil magnetite-core for each band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of the test-oscillator, first checking the frequency settings on this range by means of a crystal calibrator, or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the oscillator coil magnetite-core for each band should be re-touched so that the stations come in at the correct points on the dial.

MODEL QB11
Ch.529A

RCA MFG. CO.

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 529A
35640	Bracket—Support bracket complete with one (1) drive cord pulley
35639	Bracket—Support bracket complete with three (3) drive cord pulleys
35622	Bracket—Support bracket for tuning knob shaft
37976	Bracket—Support bracket for tone control
35642	Calibrator—Drive drum calibrator
12714	Capacitor—Air trimmer, 2-12 mmf. (C-4, C-7, C-14)
34654	Capacitor—Mica trimmer, triple, 2.5-10 mmf. (C-1, C-2, C-3)
35646	Capacitor—Ceramic, 6 mmf. (C-36)
36012	Capacitor—Ceramic, 15 mmf. (C-37)
45465	Capacitor—Ceramic, 15 mmf. (C-33)
70582	Capacitor—Ceramic, 47 mmf. (C-8)
35644	Capacitor—Ceramic, 47 mmf. (C-12)
39622	Capacitor—Mica, 56 mmf. (C-17)
39632	Capacitor—Mica, 56 mmf. (C-20, C-21)
35645	Capacitor—Ceramic, 68 mmf. (C-13)
70586	Capacitor—Mica, 68 mmf. (C-9)
39628	Capacitor—Mica, 100 mmf. (C-15, C-18, C-29)
39634	Capacitor—Mica, 180 mmf. (C-34)
39636	Capacitor—Mica, 220 mmf. (C-16)
70667	Capacitor—Mica, 560 mmf. (C-5)
70687	Capacitor—Mica, 3000 mmf. (C-6)
70644	Capacitor—Tubular, .0025 mfd., 1400 volts (C-24)
70627	Capacitor—Tubular, .005 mfd., 500 volts (C-25, C-26)
70652	Capacitor—Tubular, .01 mfd., 1000 volts (C-23, C-39)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C-19, C-27, C-35)
71010	Capacitor—Tubular, .07 mfd., 400 volts (C-22)
70619	Capacitor—Tubular, 0.5 mfd., 150 volts (C-38)
70618	Capacitor—Tubular, 0.25 mfd., 300 volts (C-28)
37250	Capacitor—Electrolytic, 20 mfd., 250 volts (C-32)
37867	Capacitor—Electrolytic, 30 mfd., 250 volts (C-30)
31581	Cell—Bias cell
35632	Coil—Antenna coil, "A", "B" and 31 meter bands (L-4, L-5, L-6, L-7, L-18)
35631	Coil—Antenna coil, 25 meter and 19-13 meter bands (L-1, L-2, L-3)
35624	Coil—Oscillator coil, 19-13 meter band (L-12)
35625	Coil—Oscillator coil, 25 meter band (L-11)
35626	Coil—Oscillator coil, 31 meter band (L-10)
35623	Coil—Oscillator coil, "A" and "B" bands (L-8, L-9)
35619	Condenser—Variable tuning condenser (C-10, C-11)
37833	Control—Volume control and power switch (R-6, S-6)
32634	Cord—Drive cord (approx. 28" overall length)
34662	Cord—Indicator cord (approx. 53" overall length)
35788	Core — Adjustable core and stud for "A" and "B" band oscillator coil
31259	Core—Adjustable core and stud for 19-13 meter, 25 meter and 31 meter bands oscillator coils
12006	Core—Adjustable core and stud for I.F. transformers
35627	Drum—Drive drum less calibrator
35638	Flywheel—Tuning knob shaft flywheel
31580	Holder—Bias cell holder
5119	Plug—3 contact female plug for speaker cable
14404	Plug—7 prong plug for power input cable
35641	Pulley—Drive cord pulley
35630	Pulley—Idler pulley, located between tuning knob and range switch shafts
30734	Resistor—5600 ohms, ¼ watt (R-7)
30151	Resistor—18,000 ohms, 1 watt (R-4)
30492	Resistor—22,000 ohms, ¼ watt (R-5)
30685	Resistor—33,000 ohms, ¼ watt (R-2)
30180	Resistor—120,000 ohms, ¼ watt (R-9)
11988	Resistor—390,000 ohms, ¼ watt (R-13)
30648	Resistor—470,000 ohms, ¼ watt (R-11)
30161	Resistor—820,000 ohms, ¼ watt (R-12)
30652	Resistor—1 megohm, ¼ watt (R-1)
30162	Resistor—1.2 megohm, ¼ watt (R-10)
30649	Resistor—2.2 megohm, ¼ watt (R-3, R-8)
14350	Screw—# 8-32 square head set screw for drive drum
35633	Shaft—Range indicator shaft
35637	Shaft—Tuning knob shaft
35787	Socket—Phono-input socket
31251	Socket—Tube socket
31418	Spring—Indicator cord spring or drive cord spring
12007	Spring—Retaining spring for I.F. transformers' core and stud assemblies
31261	Spring—Retaining spring for oscillator coils core and stud assemblies
35621	Switch—Range switch (S-1, S-2, S-3, S-4)
33397	Switch—Tone control switch (S-5)
37898	Transformer—Driver transformer (T-1)
35636	Transformer—First I.F. transformer (L-13, L-14, C-15, C-18)
35628	Transformer—Second I.F. transformer (L-15, L-16, C-20, C-21)
37924	Transformer—Output transformer (T-2)
33726	Washer—"C" washer for idler pulley
2917	Washer—"C" washer for tuning knob shaft
	VIBRATOR POWER SUPPLY
4289	Body—Fuse connector body
4288	Cap—Fuse connector cap
39644	Capacitor—Mica, 470 mmf. (C-42, C-44)
71008	Capacitor—Paper, .008 mfd., 1200 volts (C-43)
70652	Capacitor—Tubular, .01 mfd., 1000 volts (C-40)
37877	Capacitor—Electrolytic, 16 mfd., 350 volts (C-41)
37834	Case—Power supply case less cover
14289	Clip—Battery clips (1 set)
37925	Coil—Choke coil (L-21)
37836	Cover—Power supply case cover
4286	Ferrule—Fuse connector ferrule and bushing
5140	Fuse—5 ampere
4290	Insulator—Fuse connector insulator
14409	Plug—7 contact female plug for power supply cable
34765	Resistor—100 ohms, ¼ watt (R-15)
6134	Resistor—1200 ohms, 1 watt (R-14)
90382	Resistor—2200 ohms, 1 watt (R-16)
12241	Socket—Vibrator socket
4284	Spring—Fuse connector spring
35544	Transformer—Vibrator transformer (T-3, C-45, L-22)
35543	Vibrator—Plug-in vibrator
4285	Washer—Fuse connector insulating washer
	SPEAKER ASSEMBLIES 92519-1
70578	Cone—Cone and voice coil assembly
5118	Plug—3 prong male plug for speaker cable
70577	Speaker—6½" P.M. speaker complete with cone and voice coil less plug
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
70579	Decal—Trademark decal
35654	Dial—Glass dial scale
36658	Extension—Tone control shaft extension
37838	Frame—Dial frame assembly less indicator and dial
X1611	Grille—Cabinet grille cloth for Model QB11
70580	Indicator—Station selector indicator
35652	Knob—Range indicator knob
35651	Knob—Range switch knob
35650	Knob—Tone control knob
34489	Knob—Tuning or volume control knob
4982	Spring—Retaining spring for range indicator knob
14270	Spring—Retaining spring for tone control knob, tuning or volume control knob, and for range switch knob

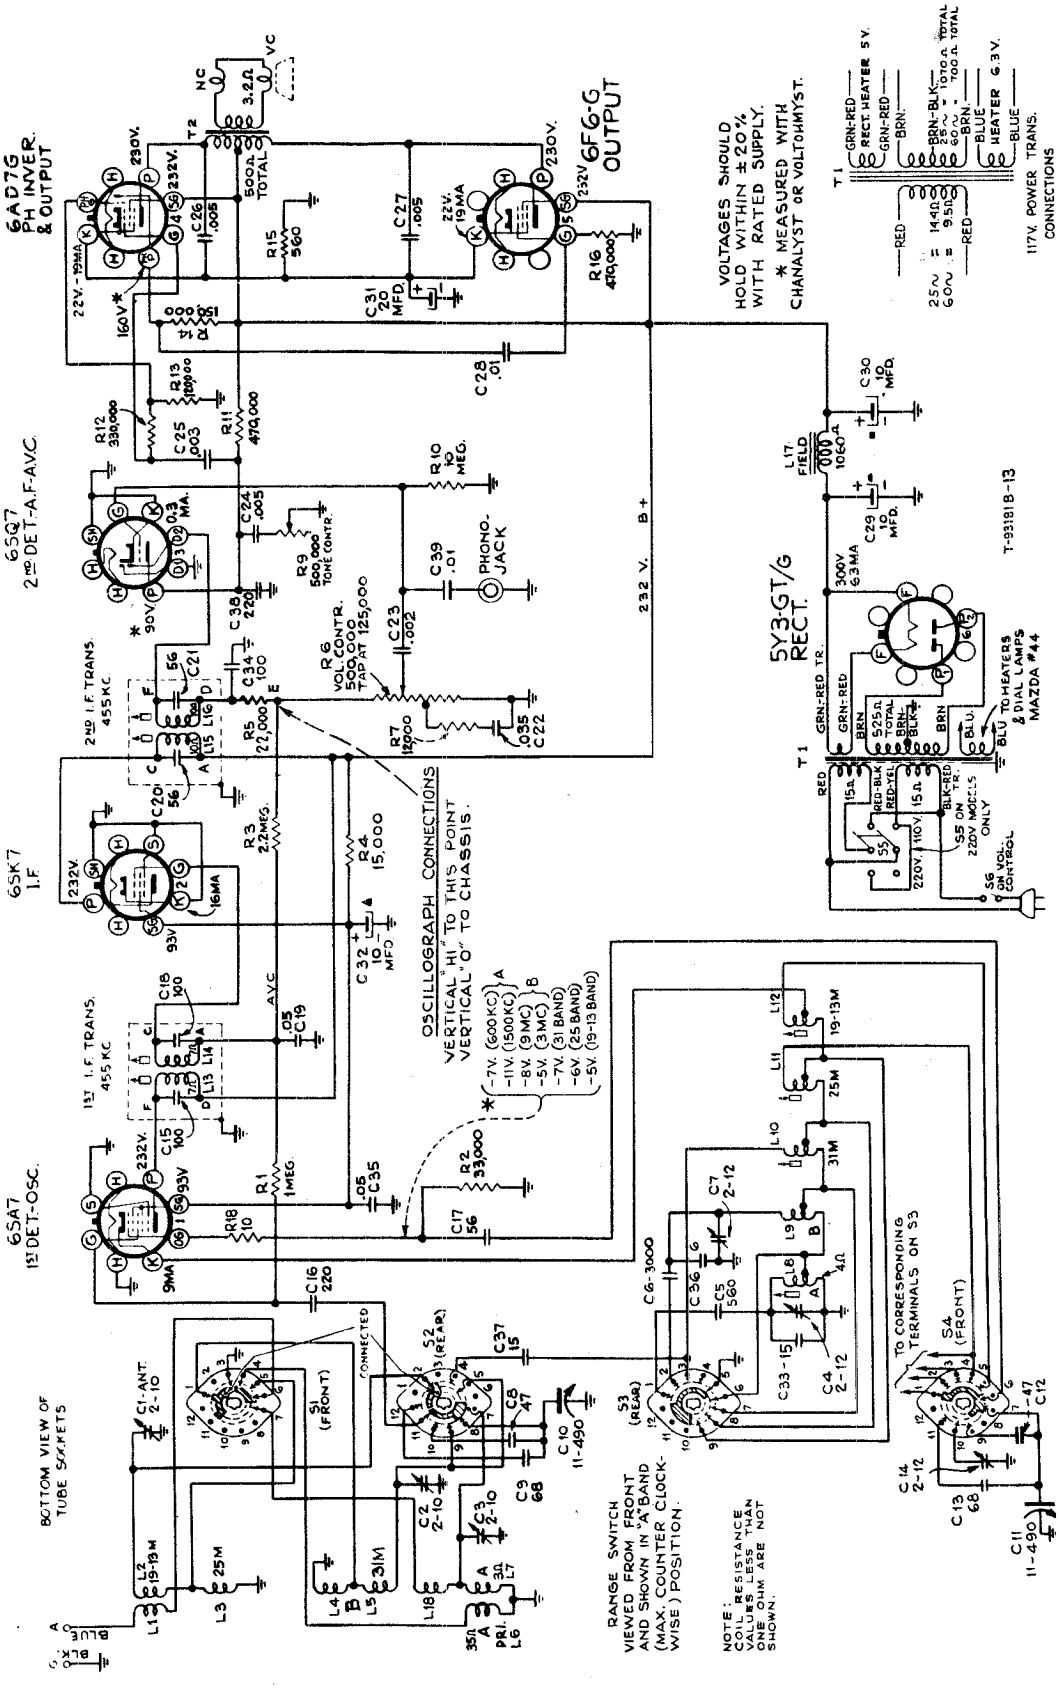
MODELS Q22A, Q32,
Ch. RC-507

RCA MFG. CO.



Loudspeaker.—

To center the loudspeaker voice coil, first remove the dust cover. Then loosen the center suspension by thoroughly soaking the outer edge of this suspension with repeated applications of acetone.

(Caution: Keep acetone from flowing to other parts of the loudspeaker.)

Keep the outer edge of the suspension soaked, and lift the cone, near the voice coil, up and down until the suspension is pulled away from the cone housing.

Insert 3 feelers, equally spaced, between the voice coil and the pole piece, and allow the center suspension to re-cement itself. Additional cement should be applied if necessary. Remove feelers when cement has hardened completely.

Precautionary Lead Dress.—

1. All leads between antenna coils and switch must be as short as possible and kept away from oscillator coil, leads and switches.
2. All oscillator coil leads must be kept apart from each other and other leads and parts.
3. Blue plate lead of 2nd I.F transformer should be dressed under other leads and against chassis.

NOTE.—On some sets C23 may be .0015 mf., C25 may be .0025 mf.

For Clarified schematics see pp. 15-9,-10.

MODELS Q22A,Q32,
Ch.507

RCA MFG. CO.

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown on the Schematic Circuit Diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the indicator-drive-cord drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The "180°" mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

To determine the corresponding frequency for any setting of the calibration scales, refer to the calibration scale drawing which shows the dial with 0-180° calibration scales drawn at top and bottom.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 540 kc mark (the first mark on "A" band to the left of "550"), and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by adjusting the magnetite-core oscillator coil for each spread-band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settinas of the test-oscillaor, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal-controlled oscillator, or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be retouched so that the stations come in at the correct points on the dial.

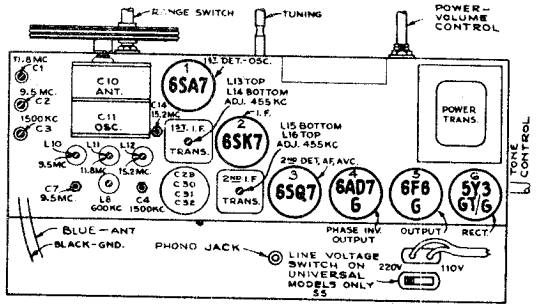
Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Range switch	Turn radio dial to—	Adjust the following for max. peak output
1	6SK7 I-F grid in series with .01 mfd.	455 kc	A	Quiet Point near 180°	L15 and L16 2nd I-F Trans.
2	6SA7 1st Det. grid in series with .01 mfd.				L13 and L14 1st I-F Trans.
3	Ant. lead in series with 300 ohms	11.8 mc	25 M	138.5°	L11 (osc.)** C1 (ant.)
4		15.2 mc		17°	C14 (osc.)*
5		Repeat steps 3 and 4			
6		15.2 mc	19-13 M	156°	L12 (osc.)**
7		9.5 mc	31 M	156°	L10 (osc.)** C2 (ant.)
8		9.5 mc	B	11.5°	C7 (osc.)***
9	Ant. lead in series with 200 mmf.	1,500 kc	A	26°	C4 (osc.) C3 (ant.)
10		600 kc		150°	L8 (osc.) (Rock gang)
11		Repeat steps 9 and 10			

* Use minimum capacity peak if two can be obtained. Check image to determine that C14 has been adjusted to the correct peak by tuning receiver to approximately 14.29 mc (29°) where a weaker signal should be received.

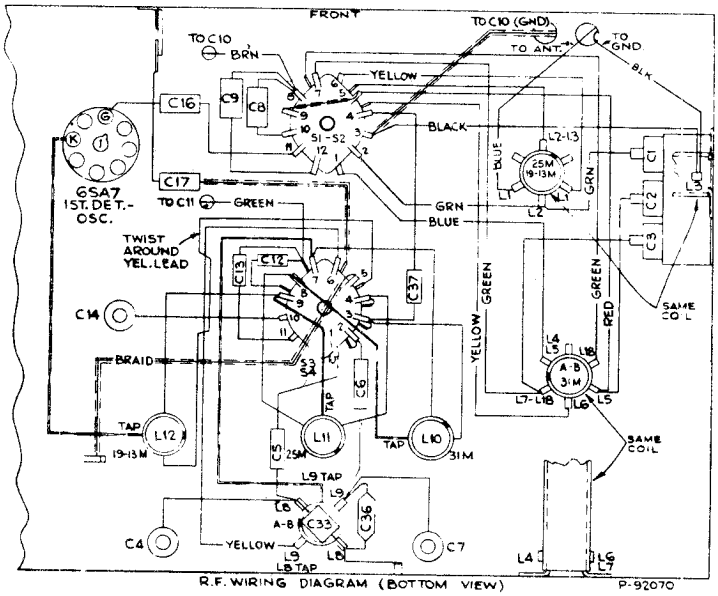
** If two peaks can be obtained use the one obtained when the core screw is farthest out (counter-clockwise).

*** Peak at minimum capacity if two peaks can be obtained.

NOTE: Oscillator tracks above signal on all bands.



Tube and Trimmer Locations



Frequency Ranges

Standard Broadcast ("A" Band)	540-1,720 kc (556-174 m)
Medium Wave ("B" Band)	3.0-9.5 mc (100-31.6 m)
"31" Meter Spread Band	9.5-11.7 mc (31.6-25.6 m)
"25" Meter Spread Band	11.7-15.1 mc (25.6-19.9 m)
"19-13" Meter Spread Band	15.1-22.5 mc (19.9-13.3 m)

Intermediate Frequency ..... 455 kc

Tuning Drive Ratio ..... 25 to 1

Power Supply Ratings

Symbol	Voltages	Frequency (cycles)	Watts
Rating A	105-125	50-60	65
Rating B	105-125	25-60	65
Rating C	105-125, 200-250	50-60	65

(Shipped in 225-250 volt position)

Victrola Attachment.—A jack is provided on the rear of chassis for connection to a Victrola Attachment. The cable from the attachment should be terminated in a Stock No. 31048 plug.

When Victrola is not in use its plug should be removed. When Victrola is in use the volume control on the radio should be at minimum and, if necessary, tune set off frequency from any very strong station.

Power Output Rating

Undistorted	3 watts
Maximum	3.5 watts

Loudspeaker

Model	92517-1
Type (Electrodynamic)	6½ inches
V-C Impedance at 400 c.p.s.	3.4 ohms

70648	Capacitor—Tubular, .005 mfd., 1000 volts (C26, C27)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C39)
70631	Capacitor—Tubular, .01 mfd., 600 volts (C28)
70614	Capacitor—Tubular, .035 mfd., 200 volts (C22)
70615	Capacitor—Tubular, .05 mfd., 200 volts (C19)
70636	Capacitor—Tubular, .05 mfd., 600 volts (C35)
35631	Coil—Antenna coil, 19-13 meter and 25 meter bands (L1, L2, L3)
35632	Coil—Antenna coil, "A," "B" and 31 meter bands (L4, L5, L6, L7, L18)
35623	Coil—Oscillator coil, "A" and "B" bands (L8, L9)
35624	Coil—Oscillator coil, 19-13 meter band (L12)
35625	Coil—Oscillator coil, 25 meter band (L11)
35626	Coil—Oscillator coil, 31 meter band (L10)
35619	Condenser—Variable tuning condenser (C10, C11)
35629	Control—Tone control (R9)
35620	Control—Volume control and power switch (R6, S6)
32634	Cord—Drive cord (approx. 28 inches overall length)
34662	Cord—Indicator cord (approx. 53 inches overall length)
12006	Core—Adjustable core and stud assemblies for I-F transformers
35788	Core—Adjustable core and stud for "A" and "B" band oscillator coil
31259	Core—Adjustable core and stud for 19-13 meter, 25 meter and 31 meter oscillator coil
35627	Drum—Drive drum less calibrator
35638	Flywheel—Tuning knob shaft flywheel
5040	Plug—4 contact female plug for speaker cable
35641	Pulley—Drive cord pulley
35630	Pulley—Idler pulley located between the range switch and tuning knob shafts
34761	Resistor—10 ohms, ¼ watt (R18)
30735	Resistor—560 ohms, 1 watt (R15)
30436	Resistor—12,000 ohms, ¼ watt (R7)
35595	Resistor—15,000 ohms, 3 watt (R4)
30492	Resistor—22,000 ohms, ¼ watt (R5)
30685	Resistor—33,000 ohms, ¼ watt (R2)
30180	Resistor—120,000 ohms, ¼ watt (R13)
30493	Resistor—150,000 ohms, ½ watt (R14)
14983	Resistor—330,000 ohms, ¼ watt (R12)
30648	Resistor—470,000 ohms, ½ watt (R11, R16)
30652	Resistor—1 megohm, ¼ watt (R1)
30649	Resistor—2.2 megohms, ¼ watt (R3)
30992	Resistor—10 megohms, ¼ watt (R10)
14350	Screw—8-32 square head set screw for drive drum
35633	Shaft—Range switch indicator knob shaft
35637	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
14278	Socket—Phono input socket
31251	Socket—Tube socket
31418	Spring—Drive cord or indicator cord spring.
12007	Spring—Retaining spring for I-F transformers' core and stud assemblies
31261	Spring—Retaining spring for oscillator coils' core and stud assemblies
35621	Switch—Range switch (S1, S2, S3, S4)
32827	Switch—Voltage switch (S5)
35636	Transformer—First I-F transformer (L13, L14, C15, C18)
35628	Transformer—Second I-F transformer (L15, L16, C20, C21)
32852	Transformer—Power transformer, 105-125 volts, 50/60 cycle or 105-125/200-250 volts, 50/60 cycle (T1)
35588	Transformer—Power transformer, 105-125 volts, 25/60 cycle (T1)
33726	Washer—"C" washer for idler pulley
2917	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY
	STAMPED 92517-1J
70578	Cone—Cone and voice coil assembly
5118	Plug—4-prong male plug for speaker
70583	Speaker—6½-inch E.M. speaker complete with cone and voice coil less plug and output transformer
70584	Transformer—Output transformer (T2)
	Note: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
35649	Back—Cabinet back for Q22A
71038	Back—Cabinet back for Q32
70579	Decal—Trade mark decal
35654	Dial—Glass dial scale
36658	Extension—Tone control shaft extension for Q32
35647	Frame—Dial frame complete less indicator
70581	Grille—Grille cloth for Q22A
X1611	Grille—Grille cloth for Q32
70580	Indicator—Station selector indicator
35652	Knob—Range indicator knob
35651	Knob—Range switch knob
35650	Knob—Tone control knob
34489	Knob—Tuning or volume control knob
11891	Lamp—Dial lamp (Mazda No. 44)
14270	Spring—Retaining spring for tone control, volume control, range switch and tuning knobs
4982	Spring—Retaining spring for range indicator knob

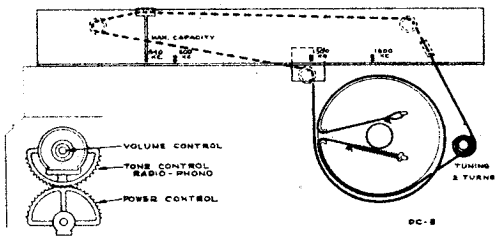
CAUTION.—CLOSE TUNING CONDENSER PLATES COMPLETELY (C-C-W) BEFORE REMOVING CHASSIS FROM CABINET.

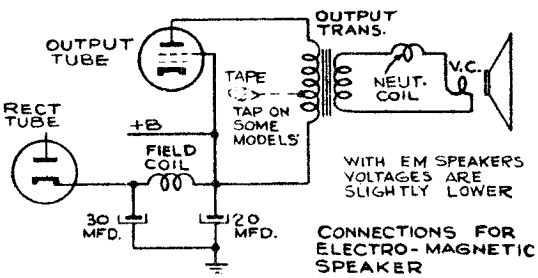
Take off both wooden strips on bottom of cabinet by removing wood screws before loosening chassis bolts.

CRITICAL LEAD DRESS.—

1. All filament wires should be dressed close to chassis.
2. Dress lead from switch to phono jack close to chassis and away from power cord.
3. Dress capacitor between 12SQ7 grid and terminal board away from chassis and away from other parts.
4. Dress all exposed leads away from each other and away from chassis to prevent short circuits.
5. In instrument assembly the lead from the rear section of gang to loop shall be dressed away from chassis and other wires to loop.



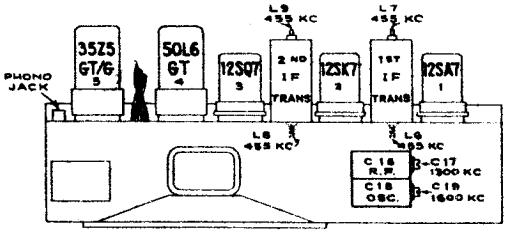
Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise plates (fully meshed). Adjust indicator pointer to left (max. cap.) mark on dial back plate.



Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf capacitor to common "—B". Keep the output signal as low as possible to avoid a.v.c. action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control clockwise to radio maximum high position (3) for alignment.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I.F. grid, in series with .01 mfd.	455 kc	Quiet point 1,600 kc end of dial	L8 and L9 2nd I.F. transformer
2	1st Det. grid in series with .01 mfd.			L6 and L7 1st I.F. transformer
	NOTE.—ANTENNA LOOP MUST BE IN CABINET			
3	Antenna terminal in series with 220 mmfd.	1600 kc	Gang at minimum	C19 (osc.)
4	Radiated signal 1300 kc		Signal Frequency	C17 (ant.)
5	Repeat steps 3 and 4.			



FREQUENCY RANGE.....540-1,600 kc

INTERMEDIATE FREQUENCY.....455 kc

POWER SUPPLY RATING

105-125 volts, AC, 60 cycles.....60 watts

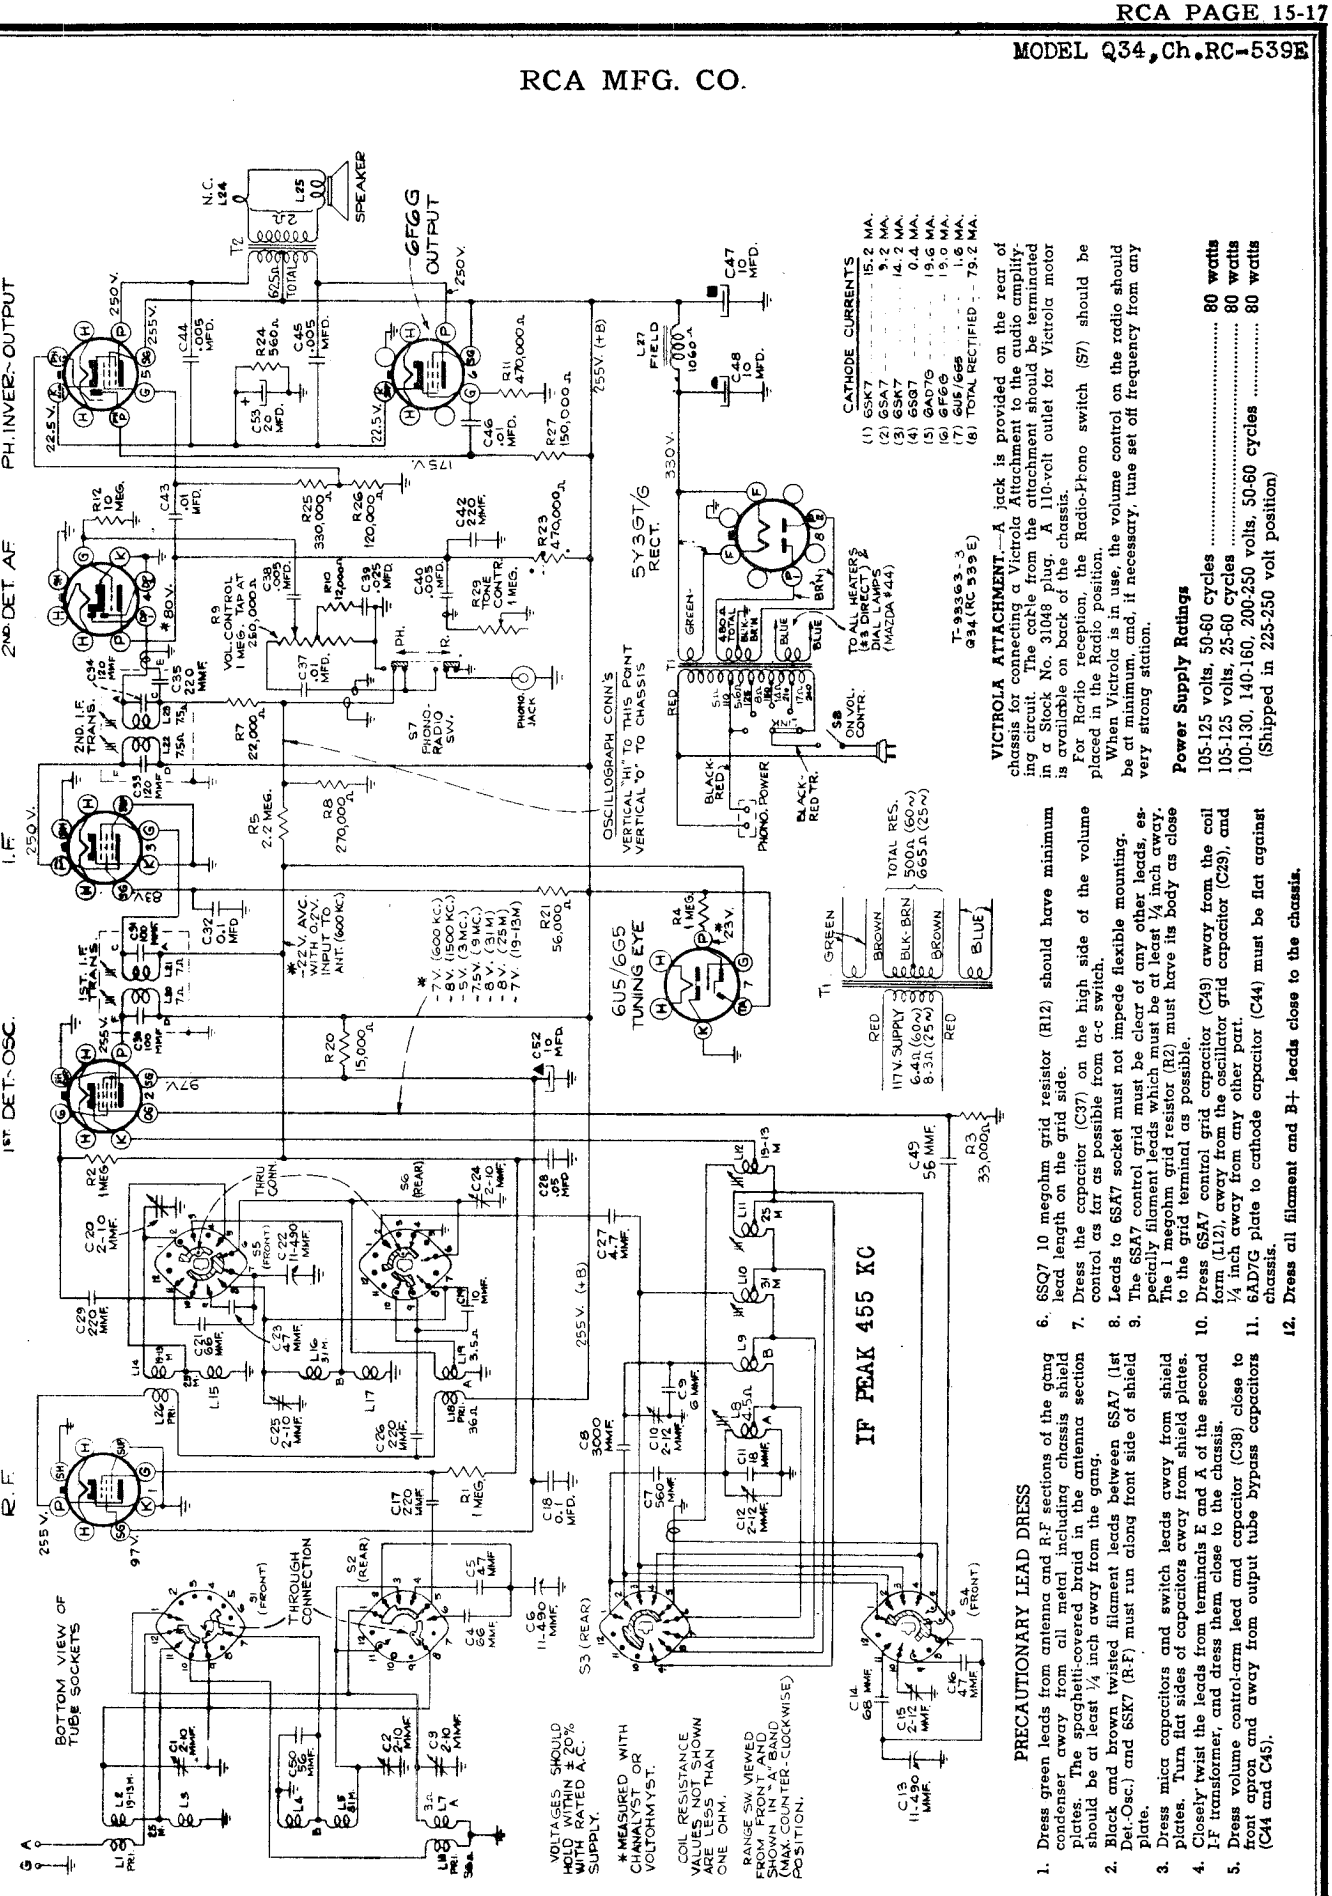
IMPORTANT.—Do not plug chassis into a d.c. power supply.

©John F. Rider

For parts list see p. 15-24. Record Changer: RCA Model 960015

MODEL Q34, Ch. RC-539E

RCA MFG. CO.



PRECAUTIONARY LEAD DRESS

1. Dress green leads from antenna and R-F sections of the gang condenser away from all metal including chassis shield plates. The spaghetti-covered braid in the antenna section should be at least ¼ inch away from the gang.
2. Black and brown twisted filament leads between 6SA7 (1st Det.-Osc.) and 6SK7 (R-F) must run along front side of shield plate.
3. Dress mica capacitors and switch leads away from shield plates. Turn flat sides of capacitors away from shield plates.
4. Closely twist the leads from terminals E and A of the second I.F transformer, and dress them close to the chassis.
5. Dress volume control-arm lead and capacitor (C38) close to front apron and away from output tube bypass capacitors (C44 and C45).
6. 6SQ7 10 megohm grid resistor (R12) should have minimum lead length on the grid side.
7. Dress the capacitor (C37) on the high side of the volume control as far as possible from a-c switch.
8. Leads to 6SA7 socket must not impede flexible mounting.
9. The 6SA7 control grid must be clear of any other leads, especially filament leads which must be at least ¼ inch away. The 1 megohm grid resistor (R2) must have its body as close to the grid terminal as possible.
10. Dress 6SA7 control grid capacitor (C49) away from the coil farm (L12), away from the oscillator grid capacitor (C29), and ¼ inch away from any other part.
11. 6AD7G plate to cathode capacitor (C44) must be flat against chassis.
12. Dress all filament and B+ leads close to the chassis.

VICTROLA ATTACHMENT.—A jack is provided on the rear of chassis for connecting a Victrola Attachment to the audio amplifying circuit. The cable from the attachment should be terminated in a Stock No. 31048 plug. A 110-volt outlet for Victrola motor is available on back of the chassis.

For Radio reception, the Radio-Phono switch (S7) should be placed in the Radio position.

When Victrola is in use, the volume control on the radio should be at minimum, and, if necessary, tune set off frequency from any very strong station.

Power Supply Ratings

105-125 volts, 50-60 cycles ..... 80 watts
105-125 volts, 25-60 cycles ..... 80 watts
100-130, 140-160, 200-250 volts, 50-60 cycles ..... 80 watts
(Shipped in 225-250 volt position)

MODEL Q34,Ch.539E

RCA MFG. CO.

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Range Switch	Turn Radio Dial to—	Adjust the following for max. peak output
1	6SK7 I-F grid in series with .01 mfd.	455 kc	"A" band	Quiet point 600 kc end of dial	L23-L22 2nd I-F transformer
2	6SA7 1st det. grid in series with .01 mfd.				L21-L20 1st I-F transformer
3	Antenna terminal in series with 300 ohms	11.8 mc	25 meter band	11.8 mc (41.5°)	L11 (osc.) C1 (ant.) C20 (det.)
4		15.2 mc		15.2 mc (161.7°)	C15 (osc.)*† Rock in
5	Repeat steps 3 and 4 until aligned.				
6	Antenna terminal in series with 300 ohms	15.2 mc	19-13 meter band	15.2 mc (24°)	L12 (osc.)**
7		9.5 mc	31 meter band	9.5 mc (23.8°)	L10 (osc.)** C2 (ant.) C25 (det.)***
8		9.5 mc	"B" band	9.5 mc (168.5°)	C10 (osc.)*
9	Antenna terminal in series with 200 mmfd.	1,500 kc	"A" band	1,500 kc (153°)	C12 (osc.) C3 (ant.) C24 (det.)
10		600 kc		600 kc (30.5°)	L8 (osc.) Rock in
11	Repeat steps 9 and 10.				

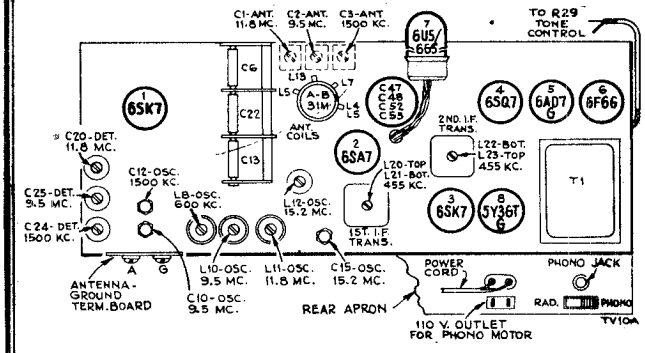
* Use minimum capacity peak if two can be obtained.

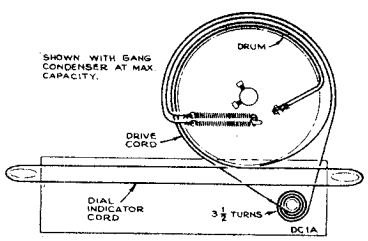
** If two peaks can be obtained, use the one obtained when the core screw is farthest out (counter-clockwise).

*** Use maximum capacity peak if two peaks can be obtained.

† Check image to determine that C15 has been adjusted to correct peak by tuning receiver to approximately 14.29 mc (147°) where a weaker signal should be received.

NOTE: Oscillator tracks above signals on all bands.





Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the rear of the indicator-drive-cord drum which is mounted on the front shaft of the gang condenser.

As the first step in r-f alignment, check the position of the drum, it should correspond to that shown in the Dial Indicator and Drive Mechanism drawing when the gang condenser plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang condenser frame, and bend the wire so that it points to the "0°" mark on the calibration scale when the plates are fully meshed.

The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

Receiver Dial with Calibration Scale.—To determine the corresponding frequency for any setting of the calibration scales, refer to the drawing.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by adjusting the magnetite-core oscillator coil for each band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal calibrator, or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be retouched so that the stations come in at the correct points on the dial.

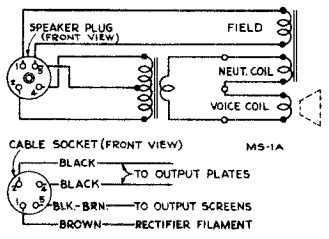
RCA MFG. CO.

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES (RC 539E)
34502	Arm—Range switch actuating arm
37053	Board—"Antenna-Ground" board
39857	Bracket—L.H. bracket complete with drive cord pulley
39856	Bracket—R.H. bracket complete with drive cord pulley
37092	Calibrator—Drive drum calibrator
33014	Capacitor—Electrolytic, comprising three (3) sections of 10 mfd., 450 volts, and 1 section of 20 mfd., 25 volts (C47, C48, C52, C53)
37059	Capacitor—Mica trimmer, triple 2.5-10 mmf. (C1, C2, C3, C20, C24, C25)
33097	Capacitor—Ceramic, 4.7 mmf. (C27)
12714	Capacitor—Air trimmer, 2-12 mmf. (C10, C12, C15)
35646	Capacitor—Ceramic, 6 mmf. (C9)
39604	Capacitor—Mica, 10 mmf. (C19)
39041	Capacitor—Ceramic, 18 mmf. (C11)
35644	Capacitor—Ceramic, 47 mmf. (C16)
70582	Capacitor—Ceramic, 47 mmf. (C5, C23)
39622	Capacitor—Mica, 56 mmf. (C49, C50)
36072	Capacitor—Mica, 66 mmf. (C4, C21)
35645	Capacitor—Ceramic, 68 mmf. (C14)
39628	Capacitor—Mica, 100 mmf. (C30, C31)
39630	Capacitor—Mica, 120 mmf. (C33, C34)
39636	Capacitor—Mica, 220 mmf. (C17, C26, C29, C35, C42)
39626	Capacitor—Mica, 560 mmf. (C7)
70687	Capacitor—Mica, 3000 mmf. (C8)
70648	Capacitor—Tubular, .005 mfd., 1000 volts (C44, C45)
70606	Capacitor—Tubular, .005 mfd., 200 volts (C38)
70627	Capacitor—Tubular, .005 mfd., 600 volts (C40)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C37)
70631	Capacitor—Tubular, .01 mfd., 600 volts (C43, C46)
70612	Capacitor—Tubular, .025 mfd., 200 volts (C39)
70615	Capacitor—Tubular, .05 mfd., 200 volts (C28)
70638	Capacitor—Tubular, .1 mfd., 600 volts (C18, C32)
37055	Coil—Antenna coil, A, B and 31 meter band (L4, L5, L7, L13)
37056	Coil—Antenna coil, 19-13 meter and 25 meter bands (L1, L2, L3)
37057	Coil—R-F coil, A, B and 31 meter bands (L16, L17, L18, L19)
37058	Coil—R-F coil, 19-13 meter and 25 meter bands (L14, L15, L26)
35624	Coil—Oscillator coil, 19-13 meter (L12)
35625	Coil—Oscillator coil, 25 meter band (L11)
35626	Coil—Oscillator coil, 31 meter band (L10)
37093	Coil—Oscillator coil, A & B band (L8, L9)
37151	Condenser—Variable tuning condenser (C6, C13, C22)
36109	Control—Tone control (R29)
37087	Control—Volume control and power switch (R9, S8)
32634	Cord—Drive cord (approx. 41 inches overall length)
32634	Cord—Indicator cord (approx. 42 inches overall length)
35788	Core—Adjustable core and stud for A & B band oscillator coil
12006	Core—Adjustable core and stud for I-F transformers
31259	Core—Adjustable core and stud for 19-13 meter, 25 meter and 31 meter band oscillator coils
37090	Drum—Drive drum
37094	Link—Link, arm and bushing assembly
5040	Plug—5 contact female plug for speaker cable
35641	Pulley—Drive cord pulley
36637	Receptacle—A-C power receptacle
30735	Resistor—560 ohms, 1 watt (R24)
30436	Resistor—12,000 ohms, ¼ watt (R10)
35595	Resistor—15,000 ohms, 3 watt (R20)
30492	Resistor—22,000 ohms, ¼ watt (R7)
30685	Resistor—33,000 ohms, ¼ watt (R3)
30650	Resistor—56,000 ohms, ½ watt (R21)
13734	Resistor—120,000 ohms, ¼ watt (R26)
30493	Resistor—150,000 ohms, ½ watt (R27)

STOCK No.	DESCRIPTION
30651	Resistor—270,000 ohms, ¼ watt (R8)
14983	Resistor—330,000 ohms, ¼ watt (R25)
30648	Resistor—470,000 ohms, ½ watt (R11, R23)
30652	Resistor—1 megohm, ¼ watt (R1, R2, R4)
30649	Resistor—2.2 megohms, ¼ watt (R5)
30992	Resistor—10 megohms, ¼ watt (R12)
14350	Screw—#8-32 square head set screw for Arm #34502 and link #37094
4669	Screw—#8-32 square head set screw for drive drum
37096	Shaft—Range indicator knob shaft
37095	Shaft—Range switch actuating shaft
37091	Shaft—Tuning knob shaft and flywheel
31364	Socket—Dial lamp socket
35787	Socket—Phono input socket
31251	Socket—Tube socket
34864	Socket—Tuning indicator tube socket
70576	Spring—Drive cord spring
31418	Spring—Indicator cord spring
12007	Spring—Retaining spring for I-F transformers' core and stud assemblies
31261	Spring—Retaining spring for 19-13 meter band and oscillator coil core and stud assemblies
33491	Switch—Radio-phono switch (S7)
37050	Switch—Range switch (S1, S2, S3, S4, S5, S6)
35636	Transformer—First I-F transformer (L20, L21, C30, C31)
36615	Transformer—Second I-F transformer (L22, L23, C33, C34 C35)
31733	Transformer—Power transformer, 105-125 volts, 50/60 cycle (T1)
31734	Transformer—Power transformer, 105-125 volts, 25/60 cycle (T1)
31735	Transformer—Power transformer, 105/130, 140/160, 200/250 volts, 50/60 cycle (T1)
34373	Washer—"C" washer for range switch actuating arm
2917	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY Stamped 92562-1J
70972	Cone—Cone and voice coil assembly
5039	Plug—4 prong male plug for speaker cable
70971	Speaker—7" x 9" EM speaker complete with cone and voice coil less output transformer and plug
70973	Transformer—Output transformer (T2)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
70589	Back—Cabinet back
70591	Board—Baffle board and grille cloth
70590	Bracket—Lamp bracket
30716	Clip—Tuning tube clip
39967	Crystal—Protective crystal for tuning tube
70579	Decal—Trade mark decal
39916	Dial—Glass dial scale
37922	Indicator—Station selector indicator
35652	Knob—Range indicator knob
35651	Knob—Range switch knob
35650	Knob—Tone control knob
34489	Knob—Volume control or tuning knob
11891	Lamp—Dial lamp
39859	Rail—Pointer rail
36641	Retainer—Retainer for tuning tube crystal
33438	Screw—Thumb screw for tube clip
14270	Spring—Retaining spring for tone control knob, volume control or tuning knob and for range switch knob
4982	Spring—Retaining spring for range indicator knob



Loudspeaker Connections

Frequency Ranges

Standard Broadcast ("A" Band)	540-1,720 kc (556-174 m)
Medium Wave ("B" Band)	3.0-9.5 mc (100-31.6 m)
31 Meter Spread Band	9.5-11.7 mc (31.6-25.6 m)
25 Meter Spread Band	11.7-15.1 mc (25.6-19.9 m)
19-13 Meter Spread Band	15.1-22.5 mc (19.9-13.3 m)

Intermediate Frequency ..... 455 kc

Power Output

Undistorted	3.25 watts
Maximum	4.5 watts

Loudspeaker

Type	7" x 9" electrodynamic
V.C. Impedance	2.2 ohms at 400 cycles
Identification Number	92562-1J

K=1000
VOLTAGES SHOULD HOLD WITHIN ± 20% WITH RATED BATTERY VOLTAGE.
* MEASURED WITH CHANALYST OR VOLTOHMYST.
ALL VOLTAGES ARE MEASURED WITH RESPECT TO CHASSIS GROUND.

P-92241 -1

Frequency Range ..... 550-1,600 kc
Intermediate Frequency ..... 455 kc

Test Oscillator.—Connect test oscillator as indicated in chart keeping the output as low as possible to avoid A V C action.

Output Meter.—Connect meter from top lug of TB1 (plate of 354) to ground. Turn volume control to maximum position.

Fig. 1 shows the modifications necessary to convert the center strip portion of a case into a convenient shield to be used as a substitute for the regular case center strip in the RF, Osc. alignment.

Steps	Connect the high side of test osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	Connection lug of C2, located on rear of gang in series with .01 mf.	455 kc	Quiet point near 1,600 kc	C11, C12 2nd I-F trans.
2		455 kc	Quiet point near 1,600 kc	C8, C9 1st I-F trans.
3	*Antenna coupling loop thru 200 mmf. capacitor	1,600 kc	1,600 kc	C5 (osc.)
4		1,500 kc	1,500 kc	C2 (ant.)
5		600 kc	600 kc	L2 (osc.)
6	Repeat steps 4 and 5 for final adjustments.			

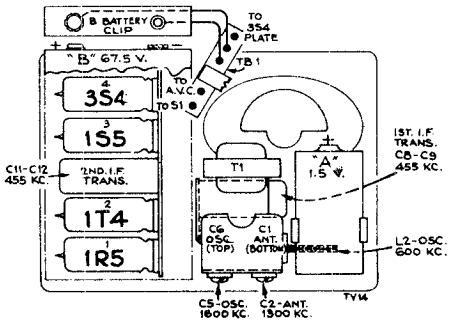
* Steps 3, 4 and 5 require a coupling loop from the signal generator to feed a signal into the receiver loop located in the lid. This loop should be approximately one turn of 6 x 3½ inches coupled to the signal generator through a 200 mmf. capacitor, and loosely coupled to the receiver loop antenna at about 1¾ inches distance, so as not to disturb the receiver loop inductance. Ground test oscillator through .1 mf. capacitor to receiver chassis.

Tools required:

1. One Phillips No. 1 screwdriver.
2. One small neutralizing alignment tool.

CRITICAL LEAD DRESS

1. Dress blue, green and black leads of second I-F transformer as direct as possible. If excess lead exists, dress down side of socket and flat against chassis to transformer opening.
2. Cross the green and the black leads inside the first I-F transformer can, keeping the green lead to the outside. Keep the blue and the green leads separated as far as possible throughout their length.
3. Dress audio coupling capacitor (C14; .002 mf.) and the lead to the volume control up and underneath the shelf supporting the output transformer.
4. Dress the three capacitors pyramided behind the speaker, parallel to the complete assembly and with enough room behind the battery holder to allow the holder to move when a battery is installed or removed.
5. Dress the "B" battery leads behind the gang frame and over the top of the output transformer.
6. Observe the outside foil connections on all paper capacitors, also the polarity of the electrolytic capacitor (C17).
7. Keep blue and red leads of output transformer above the mounting shelf.



Note: DO NOT install "A" battery without cardboard cover.

A rubber band should be placed around each tube for cushioning.

©John F. Rider

RCA MFG. CO.

Replacement of Component Parts

I. **To remove back cover:**

a. Depress locking spring clip through hole in top of case.

b. With spring clip depressed, pull cover carefully out and up off the locking lug in the bottom of the case.

II. **To replace batteries:**

a. Remove back cover.

b. Remove, either or both, the "A" and "B" battery as the case may warrant. The "B" battery snap fasteners can best be removed by inserting a screwdriver under the snap fastener strip and prying upward.

III. **To remove the case center strip:**

a. Remove one screw on the inside near the back cover.

b. Tilt case center strip and lift.

IV. **To replace tubes:**

a. Remove back cover.

b. Remove "B" battery.

c. Remove case center strip.

d. Remove and replace tubes as required.

V. **To remove the escutcheon plate (top cover):**

a. Remove the main dial knob, just pull.

b. Remove the four corner nuts (B), rear.

c. The plate may either be removed from the stay arm or folded into the lid.

VI. **To remove speaker:**

a. Remove escutcheon plate (see item V above).

b. Remove two Phillips screws (C) on chassis front of panel assembly holding speaker.

c. Unsolder voice coil leads.

d. Slide forward away from hinge side.

VII. **To remove output transformer:**

a. Remove speaker (see item VI).

b. Remove rivet (when replacing use small brass bolt).

c. Unsolder mounting lug and leads.

d. Pull out transformer.

VIII. **To remove volume control:**

a. Remove speaker (item VI).

b. Unsolder (disconnect) lead to positive terminal of "A" battery holder.

c. Lift up the "A" battery holder by removing the one screw in its base. This holder has a hinge action and must be lifted up and back to remove.

d. Remove front plate (panel) as follows:

1. Unsolder two copper strips (E) (from end of tube shelf to front plate) located under tubes 1R5 3S4.
2. Remove two screws (F) holding tube shelf to front plate. These screws are located between tubes 1R5 and 1T4, also 3S4 and 1S5. Rubber shock mounts may stick on studs, pry loose.
3. Remove nut (G) beneath tube shelf below second I-F transformer.
4. Remove screw (G) beneath the negative terminal of "A" battery holder, near cover hinge and also screw (G) adjacent to volume control below "A" battery holder near release catch.
5. Unsolder three chassis leads to cover switch assembly or remove the switch assembly from the front cover plate.
6. Lay chassis on board or jig.
7. Remove front plate.
8. Unsolder volume control leads.
9. Remove volume control knob and spider.
10. Remove volume control assembly by bending back four lugs.

Caution: Do not close lid unless center screw of switch assembly is in place.

e. Reassemble in reverse order.

IX. **To remove oscillator coil:**

a. Same procedure and steps as covered in item VIII for removal of volume control plus the following.

b. Unsolder oscillator coil leads.

c. Remove coil by unsnapping spring mounting clips from angle bracket.

X. **To remove 1st I-F transformer:**

a. Remove speaker.

b. Unsolder four leads from 1st I-F transformer.

1. Blue to plate (screen used as plate) of 1R5 tube.
2. Green to grid of 1T4 tube.
3. Red to B+ terminal of 5 lug terminal board adjacent output transformer.
4. Black to AVC terminal of same strip as above.

c. Remove connections as required from two lug terminal board adjacent to 1st I-F transformer to permit this terminal board to be moved to a position free of the 1st I-F transformer.

d. Unsolder and bend mounting lugs straight on the I-F transformer can. These lugs are immediately below the 2nd I-F transformer on tube shelf.

e. Slip 1st I-F transformer forward toward volume control and out.

Note: It is possible to fold the 1st I-F transformer out the front of the chassis if the front plate is removed. This will eliminate the unsoldering of leads from the two lug terminal board.

XI. **To remove 2nd I-F transformer:**

a. Carefully remove the two 0.02 uf C10, C15 capacitors.

b. Carefully depress the two leads (B+ and A+) near the I-F transformer case mounting lugs and unsolder these lugs from the tube mounting shelf and bend out.

c. Unsolder the blue (plate of 1T4), green (grid of 1S5), red (B+ on terminal board), and black leads.

d. Remove 2nd I-F transformer.

XII. **To remove condenser tuning gang:**

a. Loosen oscillator coil.

b. Unsolder leads to tuning gang.

c. Unsolder grounding straps.

d. Remove three screws holding gang assembly to chassis.

e. Remove gang from rear of chassis.

XIII. **To remove loop assembly:**

a. Unsolder loop leads in chassis.

b. Remove screw holding fish paper insulating envelope to chassis switch.

c. Remove snap fasteners holding loop in cover.

70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C3, C4)
70408	Capacitor—Electrolytic comprising 1 section of 30 mfd., 150 volts and 1 section of 50 mfd., 150 volts (C12, C13)
70403	Coil—Oscillator coil
70383	Condenser—Variable tuning condenser complete with drum (C18, C16)
70322	Control—Volume control, 0.5 megohms (R10)
32634	Cord—Drive cord (approx. 48" overall length)
70392	Cord—Power cord
70384	Drum—Drive drum
70397	Gear—Power or radio-phono switch gear
70395	Gear—Volume control gear and spring assembly
70404	Indicator—Station selector indicator
70391	Insulator—Bakelite insulator for phono input socket
11765	Lamp—Dial lamp
70393	Loop—Antenna Loop (L1, L2)
70382	Plate—Dial back plate complete with pulleys less dial
30868	Plug—2 contact female plug for AC cable
36230	Pulley—Drive cord pulley
30880	Resistor—150 ohms, ¼ watt (R7)
6134	Resistor—1200 ohms, 1 watt (R9)
30492	Resistor—22,000 ohms, ¼ watt (R2)
14583	Resistor—220,000 ohms, ¼ watt (R1, R5)
30648	Resistor—470,000 ohms, ¼ watt (R8)
12928	Resistor—3.3 megohm, ¼ watt (R4)
31455	Resistor—5.6 megohm, ¼ watt (R6)
14974	Screw—#8-32 x 3/16" long set screw for lower gear
70388	Shaft—Tuning knob shaft
34449	Socket—Lamp socket
35787	Socket—Phono input socket
37605	Socket—Tube socket—moulded
70390	Spring—Drive cord tension spring
70396	Spring—Volume control gear tension spring
70394	Switch—Power or radio phono switch (S1)
70386	Transformer—First I.F. transformer (L6, L7; C20, C21)
70387	Transformer—Second I.F. transformer (L8, L9; C22, C23; C6, C7)
70385	Transformer—Output transformer
33726	Washer—"C" washer for tuning knob shaft
70406	Washer—Spring washer for volume control
	SPEAKER ASSEMBLY 922279-1
70405	Speaker—4" x 6" P.M. speaker complete NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
X1605	Board—Baffle board and grille
70398	Clamp—Dial clamp (1 set)
35392	Decal—Trademark decal (RCA Victor)
70575	Decal—Trademark decal (Dog)
70402	Dial—Dial scale
70707	Hinge—Cabinet lid hinge (2 required)
70401	Knob—Power or radio-phono switch knob
70400	Knob—Tuning knob
70399	Knob—Volume control knob
14270	Spring—Retaining spring for tuning knob and volume control knob
39545	Support—Lid support

POWER OUTPUT

Undistorted	1.5 watts
Maximum	2.4 watts

LOUDSPEAKER (M922279-1) "PM"

Size	4 x 6 inch elliptical
V.C. Impedance	3.4 ohms at 400 cycles
Some models may have	5 inch PM

PHONOGRAPH

Type	Automatic (T960015)
Record Capacity	Twelve 10-in., Ten 12-in.
Turntable Speed	78 r.p.m.
Type Pickup	Crystal
Motor Power Consumption	25 watts

NOTE: FOR BATTERY OPERATION TAPE LUG. FOR ELECTRIFIER OPERATION, CONNECT LUG TO CHASSIS.
LUG

Cathode Ray Alignment is the preferable method. Connections for the oscillograph are shown in the diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

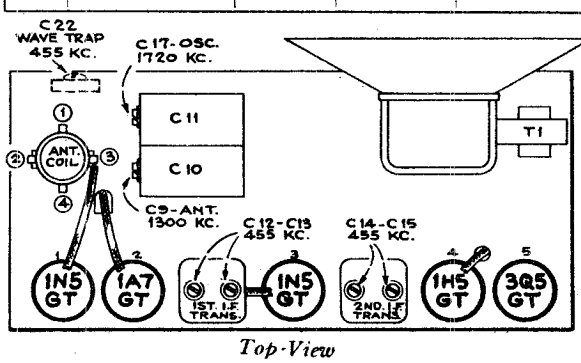
Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis, and keep the output as low as possible to avoid AVC action.

Pre-Setting Dial.—With gang condenser in full mesh, the pointer should be set at the left-hand end dial calibration mark.

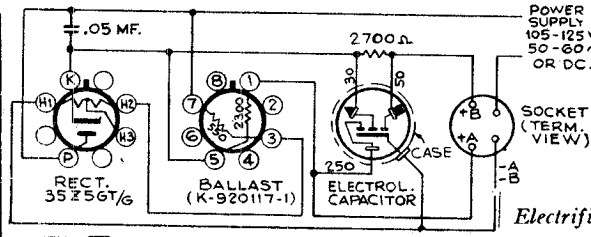
Precautionary Lead Dress.—

1. The lead from the 3Q5 plate to output transformer should be dressed under clip and away from audio input leads.
2. All filament wires should be dressed close to chassis.
3. Keep AVC lead connecting C1, (0.1 mfd. filter) to antenna coil away from the 1A7GT plate.
4. Keep blue plate leads coming from I.F. transformers short and close to chassis.
5. Keep yellow leads connecting to oscillator coil away from trap coil.
6. Keep grid lead of 1N5GT RF tube away from 1A7GT grid.
7. Keep green lead from second I.F. transformer short and close to ground.

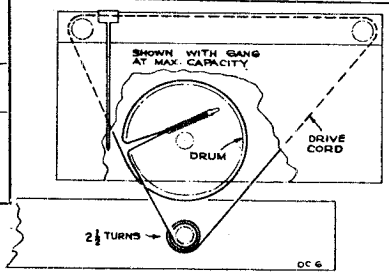
Step	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I-F grid in series with .01 mfd.	455 kc	Quiet point between 550 and 750 kc	C14, C15. (2nd I-F Trans.)
2	1A7GT grid in series with .01 mfd.			C12, C13 (1st I-F Trans.)
3	Antenna terminal in series with 200 mmfd.	1,720 kc	Tuning condenser rotor plates all out	C17 (osc.)
4		1,300 kc	1,300 kc signal	C9 (ant.)
5		455 kc	Quiet point between 550 and 750 kc	Adjust C22 for minimum output on strong 455 kc signal



Top View



Electrifier Schematic



FREQUENCY RANGE.... .540-1,720 kc
INTERMEDIATE FREQUENCY.. ..455 kc
MAXIMUM POWER OUTPUT... .3 watt

IMPORTANT

Remove any external ground connections when using the Electrifier.

CAUTION: Turn power switch off (counter-clockwise) when installing or replacing tubes or batteries.

RECEIVER IS SHIPPED READY FOR BATTERY OPERATION. FOR ELECTRIFIER OPERATION, REMOVE TAPE FROM LUG AT REAR OF CHASSIS AND CONNECT LUG TO CHASSIS.

On a DC power supply, if no reception is obtained, reverse the plug in the outlet and retune. On an AC supply, reversal of the plug may reduce hum. CAUTION! Do not touch Radio Chassis unless power plug is removed from socket.

30847	Capacitor—.05 mfd., 400 volts
28451	Cover—Insulating cover for electrolytic capacitor
35069	Fastener—Push fastener for bottom cover
28452	Plate—Bakelite mounting plate for electrolytic capacitor
38702	Resistor—Ballast tube resistor
30730	Resistor—2,700 ohms, ½ watt
31027	Socket—Power output socket
31251	Socket—Tube or ballast resistor socket
38702	Tube—Ballast tube resistor

CIRCUIT DESCRIPTION.—Superheterodyne with one stage of radio frequency amplification, automatic volume control and class "A" beam power output. Battery operation, with optional AC-DC socket power attachment available. Model 55F can be operated on 105-125 volts AC, 50-60 cycles, or 105-125 DC, by means of an RCA CV-42 Electrifier.

LOUDSPEAKER (5 inch) 92515-1
Voice coil impedance at 400 cycles.....3.4 ohms

POWER SUPPLY
Battery.....RCA VS022 or equivalent
Battery Drain
"A" 1½ volt section.....3 ampere
"B" 90 volt section.....10 m.a. (Switch in "Battery Saver Position")
14 m.a. (Maximum Output Position)

POWER CONSUMPTION
With CV-42 Electrifier Unit (switch in "Electric" position).....22.5 watts
Cabinet Dimensions (inches).....18 x 9¼ x 10⅝

Models 56X, 56X2, 56X3

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	Stator of C-12 in series with .01 mfd.	455 kc	Quiet-point 1,600 kc end of dial	C18 and C19 2nd I-F transformer
2				C16 and C17 1st I-F transformer
3	Ant. lead in series with 200 mmfd.	1,300 kc	1,300 kc	C14 (osc.) C13 (ant.)
4	Repeat step 3.			

Test Oscillator. Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf capacitor to common "-B." Keep the output signal as low as possible to avoid AVC action.

Output Meter. Connect leads between speaker voice coil and chassis. Turn volume control to maximum clockwise, tone control to maximum highs (clockwise).

Dial Pointer Adjustment. Rotate tuning condenser fully counter-clockwise (plates closed). Adjust indicator pointer to left (max. Cap.) mark on dial back plate.

RCA MFG. CO.

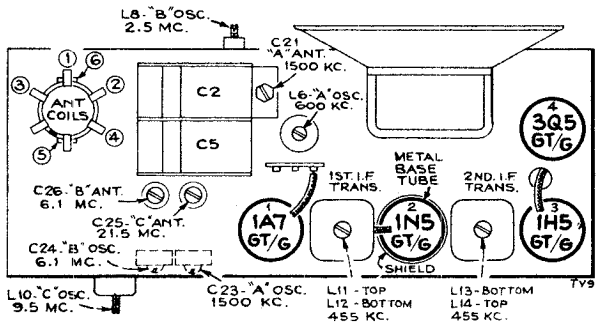
Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis and keep the oscillator output as low as possible to avoid AVC action.

Calibration Scale.—The dial backing plate has 6 marks which correspond to the frequencies indicated on the "Dial Indicator and Drive Mechanism" drawing. These marks are used during alignment.

Before alignment, set the dial pointer so that, with the tuning condenser gang in full mesh, the pointer is 1/16 inch to the left of the left hand mark on the dial backing plate.



PRECAUTIONARY LEAD DRESS

1. The 220 mmf. condenser (C1) from the gang to the wiring panel on top of chassis to be dressed away from the chassis.
2. All oscillator plate leads to coils and switch to be as short and direct as possible.
3. The green lead from r-f section of the tuning condenser gang to terminal No. 3 on switch S1 to be dressed as near as possible to terminal No. 10 on switch S2 and to the green lead from oscillator section of the tuning condenser gang.
4. The black lead from terminal No. 9 on switch S2 to L10 to be dressed below and touching the black lead from terminal No. 2 on switch S1 to the C-band antenna trimmer (C25).
5. The red lead from the B-band oscillator trimmer (C24) to the B-band oscillator coil (L8) to be dressed above and touching the yellow lead from terminal No. 1 on switch S1 to the B-band antenna trimmer (C26).
6. The 100 mmf. mica capacitor (C3) from oscillator section of the condenser gang to terminal 5 of IA7GT/G socket dressed away from the chassis.

Steps	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust following for max. peak output—
1	1N5GT/G IF grid cap in series with .01 mfd.	455 kc	"A" Band Quiet Point at High Freq. End	L14 and L13 (2nd I-F Trans.)
2	1A7GT/G 1st det. grid cap in series with .01 mfd.			L12 and L11† (1st I-F Trans.)
3	Antenna Lead in series with 200 mmf.	1,500 kc	1,500 kc mark	Peak C23 (osc.) and C21 (ant.)
4		600 kc	600 kc mark	L6 (osc.)**
5		Repeat steps 3 and 4.		
6	Antenna Lead in series with 300 ohms	6.1 mc	6.1 mc mark	Peak C24 (osc.)* and C26 (ant.)
7		2.5 mc	2.5 mc mark	L8 (osc.)**
8		Repeat steps 6 and 7.		
9		9.5 mc	9.5 mc mark	L10 (osc.)**
10		21.5 mc	21.5 mc mark	C25 (ant.)**

* Use minimum capacity peak if two peaks can be obtained.

** Rock gang slightly for peak output.

† Do not readjust L14 or L13 when test oscillator is applied to IA7-GT/G grid.

VICTROLA ATTACHMENT

A jack is provided on the rear of chassis for connecting a Victrola Attachment to the audio amplifying circuit. The cable from the attachment should be terminated in a Stock No. 31048 plug.

When Victrola is not in use its plug should be disconnected.

When Victrola is in use, the volume control on the radio should be at minimum, and, if necessary, tune set off frequency from any very strong station.

Frequency Ranges

Standard Broadcast ("A" Band) ...540-1,720 kc (555-174m)
Medium Wave ("B" Band) .....2.3-7.1 mc (130-42.2 m)
Short Wave ("C" Band) .....7.1-22 mc (42.2-13.6 m)

Intermediate Frequency .....455 kc

Batteries Required

1—RCA-VSO22 Battery Pack or equivalent
Or: 1—1½ Volt "A" Battery and 2—45 Volt "B" Batteries

Battery Drain

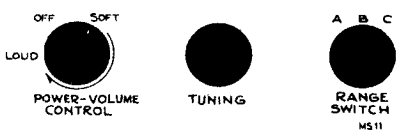
"A" ..... 0.25 amp.
"B" ..... 12.5 ma.

Power Output

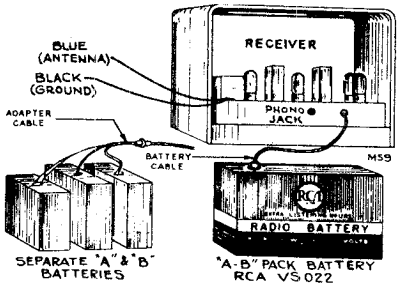
Undistorted ..... 0.20 watt
Maximum ..... 0.26 watt

Loudspeaker (92510-1)

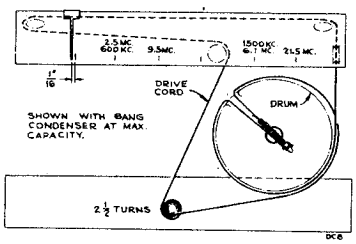
Type .....5-inch permanent-magnet dynamic
Voice-coil impedance .....4 ohms at 400 cycles



Dial Controls



Power Connections



Dial Indicator and Drive Mechanism

NOTES:

1. A four wire cable with plug is provided for making connection to the RCA-VSO22 battery pack or equivalent.
2. When separate batteries are used, an adapter extension cable is necessary.
3. A good ground connection is essential for best results.

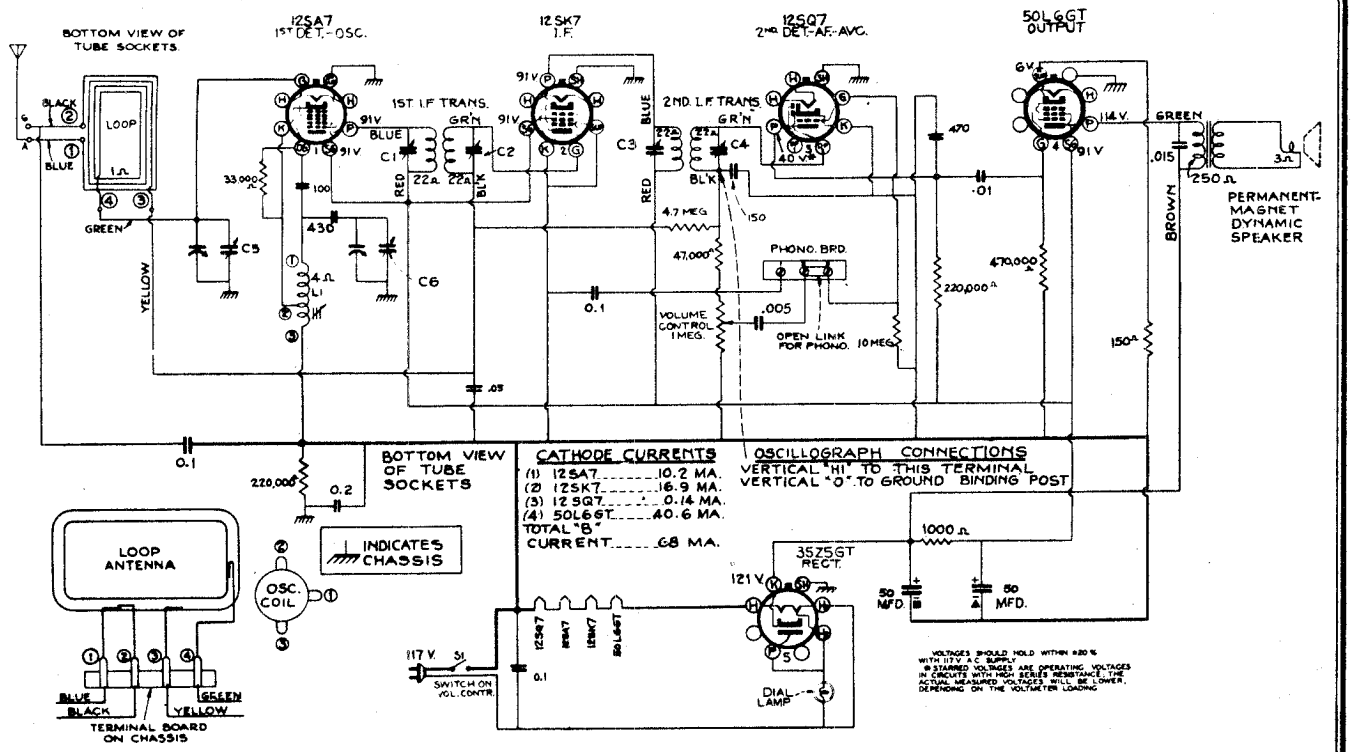
Cabinet Dimensions (inches)

Height ..... 7⅝ inches
Width ..... 12⅛ inches
Depth ..... 6¾ inches

©John F. Rider

MODEL X-55, Ch. RC-473A

RCA MFG. CO.



Schematic Circuit Diagram

FREQUENCY RANGE ..... 540-1,720 kc
INTERMEDIATE FREQUENCY ..... 455 kc
Number of Push Buttons ..... Six

DIAL LAMP (1) ..... Mazda No. 51, 7.5 volt, 0.2 amp.

POWER OUTPUT (125 volts, 60 cycle supply)
Undistorted ..... 0.8 watts
Maximum ..... 1.4 watts

POWER SUPPLY RATINGS
A-C Rating ..... 105-125 volts, 50-60 cycles, 35 watts
D-C Rating ..... 105-125 volts, direct current, 35 watts

LOUDSPEAKER (RL 85-2)
Type ..... 5-inch permanent magnet dynamic
Voice Coil Impedance ..... 4.5 ohms at 400 cycles

Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown on the schematic drawing.

Output Meter Alignment.—If this method is used, connect the output meter across the voice coil, and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver ground binding post, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Marks.—The tuning dial is fastened in the cabinet and can not be used for reference during alignment. Therefore calibration marks have been stamped in the plate on the front of the chassis as shown in the accompanying drawing. These marks are used for reference during alignment.

Dial Indicator Adjustment.—With the gang condenser in full mesh, the indicator should be set to the extreme left (low frequency) mark on the dial scale.

Steps	Connect the high side of the test-osc. to—	Tune test osc. to—	Turn radio dial to	Adjust the following for maximum peak output
1	Ant. terminal	455 kc	Quiet Point between 1,720-1,500 kc	C3 and C4 (2nd I-F trans.)
2	Ant. terminal			C1 and C2 (1st I-F trans.)
3	Ant. terminal in series with 200 mmfd.	1,500 kc	1,500 kc calibration mark	C8 (osc.) C5 (ant.)
4		600 kc	600 kc calibration mark	L1 (osc.) (Rock in)
5	Repeat step 3.			

After mounting chassis in cabinet, check the dial calibration on stations of known frequency. If calibration is not correct, move pointer to agree with dial calibration. **Note.**—Oscillator tracks above signal.

RCA MFG. CO.

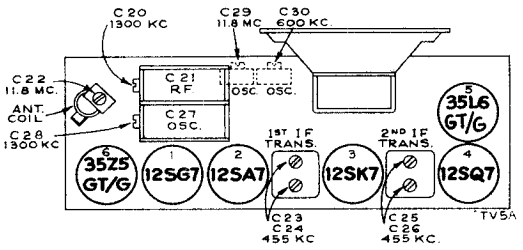
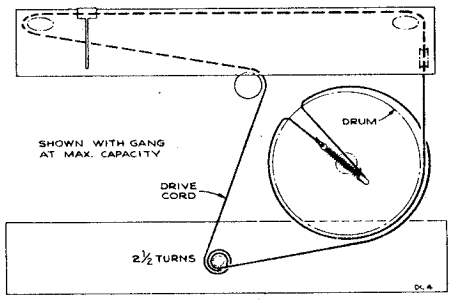
Models 56X5 and 56X10

Critical Lead Dress

1. Dress blue and green leads of both I-F transformers back in shield cans, leaving them as short as possible
2. Dress R-F plate filter capacitor (C2, 0.1 mf.) back against rear chassis apron.
3. Dress yellow and brown leads from 2nd I-F away from all other leads.
4. Dress all heater leads next to chassis.
5. Dress capacitor (C13, .01 mf.) parallel to osc. coil and approximately 3/16 inch from coil.
6. Dress tone control lead and speaker field leads next to chassis and front apron.
7. Dress pilot lamp leads away from ant. coil.
8. Dress leads from loop ant. coil around rectifier tube towards end of chassis.
9. Dress output plate lead against chassis.





Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf. capacitor to common "—B." Keep the output signal as low as possible to avoid A.V.C. action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum clockwise position, station selector switch to broadcast maximum high position (pos. 1), for broadcast alignment and to position 3 for high frequency band.

Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates fully meshed). Adjust indicator pointer to left (max. cap.) mark on dial back plate.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate.

Power Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	Pin #8 of 12SA7 in series with 0.1 mfd.	455 kc	Quiet Point at 1,600 kc end of dial	C25, C26 2nd I-F trans.
2				C23, C24† 1st I-F trans.
3	Ant. terminal in series with 220 mmf.	600 kc	600 kc "A" Band	C30 (osc.) Rock gang
4		1300 kc	1300 kc "A" Band	C28 (osc.) C20 (R-F)
5		Repeat 3 Rocking gang		
6		Repeat 3, 4 and 5 for exact cal.		
7	Ant. terminal in series with 0.1 mfd.	11.8 mc	11.8 mc	C29 (osc.)* Rock gang
8	Ant. terminal in series with 47 mmf.	11.8 mc	11.8 mc	C22 (R-F) Rock gang
9	Repeat steps 7 and 8			

* Use minimum capacity peak if two can be obtained. Check for selection of correct peak by tuning receiver to approximately 10.9 mc where a weaker signal should be received.

† Do not readjust C25 or C26

Critical Lead Dress

1. Dress all heater leads down to chassis.
2. Dress excess leads from I.F. transformers back into cans, also blue and green leads should be dressed near to chassis.
3. Lead from band switch, terminal four, to C-24, should be dressed toward front apron and just clear of oscillator coil.
4. C-29, on band switch, connected from terminal three to terminal four, should be dressed toward rear of switch assembly.
5. Excess dial lamp leads should be dressed on top of chassis.
6. C-11, output tone control condenser, should be dressed close to chassis to clear when entering cabinet.
7. Power cord should be dressed free, and not under any other leads.
8. C-4 should be dressed clear of any other components or wiring and away from chassis.
9. Lead from tone control condenser, C-8, to band switch-terminal five, should be dressed over oscillator coil and oscillator padders C-24, C-25.
10. Lead from short-wave antenna coil to loop antenna should be to the right (outside) of 35Z5GT/G.
11. Leads to loop antenna should be dressed between I.F. transformer and 12SA7.
12. Yellow and brown leads from second I.F. transformer to volume control should be dressed up and away from chassis.

Alignment Procedure

Test Oscillator.—For all alignment operations, keep the output as low as possible to avoid a.v.c. action.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate for quick reference during alignment.

Power Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I.F. grid in series with .01 mfd.	455 kc	'A' Band Quiet point at 1600 kc end of dial	C34, C35 2nd I-F trans.
2	12SA7 grid in series with .01 mfd.			C32, C33 1st I-F trans.
3	Antenna terminal on loop in series with 220 mmf.	600 kc	'A' Band rock gang near 600 kc	C25 (BC trimmer)
4		1600 kc	1600 kc	C28 (Osc.)
5		600 kc	Rock gang near 600 kc	Recheck C25
6		1300 kc	1300 kc	C22 (r.f.)
7	Antenna terminal on loop in series with 22 mmf.	15.2 mc.	'C' Band rock gang near 15.2 mc.	C20 (ant.) on top of S.W. ant. coil
8			15.2 mc. center of "M"—"19M"	C24 (Osc.)*
9		9.5 mc.	9.5 mc.	C23 (r.f.)
10		15.2 mc.	15.2 mc.	Recheck C20

*Use minimum capacity peak, if two peaks can be obtained.

Note.—Oscillator tracks 455 kc above signal on both bands.

RCA MFG. CO.

Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the full size scale printed in this service note can be used for reference.

Using Tuning Dial.—

1. Remove glass dial from the cabinet.
2. With gang in full mesh, the dial pointer should be set to a point 1/16 inch to left of reference mark at left hand end of the dial backing plate.
3. Support the glass dial over the pointer with spacers so that the extreme left scale graduation coincides with the pointer. Use scotch tape to hold the glass dial in place.

"C" Band Reception.—For best reception on "C" band with an outside antenna, adjust the trimmer screw of C5 on the antenna coil. Turn screw carefully with an insulated screwdriver (RCA Stock No. 31031) while the receiver is tuned to a station in the 31-meter band. If returning to internal antenna at any time, close the link on the center terminal and readjust "C" band antenna trimmer (C5) for best reception on 31-meter band.

For additional information, refer to booklet "RCA Victor Receiver Alignment."

Steps	Connect test-osc. output to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	"A" band 540 kc	L13-L12 (2nd I-F trans.)
2	1st Det. grid in series with .01 mfd.			L11-L10 (1st I-F trans.)
3	A-Terminal in series with 47 mmfd. (link closed)	15.2 mc	"C" band 15.2 mc	C8 (osc.)* C7 (ant.)
4		9.5 mc	"C" band 9.5 mc	C5 (ant.) (Rock gang)
5		Repeat steps 3 and 4		
6	Yellow loop lead in series with 200 mmfd. (link closed)	1,500 kc	"A" band 1,500 kc	C10 (osc.)
7		600 kc	"A" band 600 kc	L9 (osc.)
8		Repeat steps 6 and 7		
9	Install and connect chassis in cabinet with antenna link closed. Tune in a radiated oscillator signal at 1,500 kc. and peak the "A" band trimmer C2 (on loop). Rock in L9 for peak output at 600 kc.			

*Use minimum capacity peak if two peaks can be obtained. Oscillator tracks 455 kc. above signal on all bands.

Critical Lead Dress:

1. Bus from "C" oscillator coil to range switch must be held to length and dressed close to coil.
2. C30 (audio coupling capacitor to volume control) should be dressed close to front apron.
3. A.C. cord and motor leads must be dressed away from phono and F.M. jack.
4. Excess trans. leads to be dressed between trans. and rectifier socket.
5. Keep R5, C16 bus (in grid circuit of 6SA7 tube) as short as possible.
6. Dress C28 (in plate circuit of 1st A.F.) close to socket.
7. Keep R21 (grid resistor) and C34 (coupling capacitor of output tube) close to socket.
8. Keep R25, C48 (in tone compensating circuit) close to front apron.
9. Dress green lead from osc. coil to trimmer close to oscillator coil.
10. Dress red A.C. leads away from I.F. trans. and 6SQ7 socket.
11. RF choke in plate of 6SG7 must be dressed toward back apron.

RCA MFG. CO.

PUSH BUTTON ADJUSTMENT.—

The push buttons connect to separate magnetite-core oscillator coils and separate ant. circuit trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow about five minutes warm-up period before making adjustments.

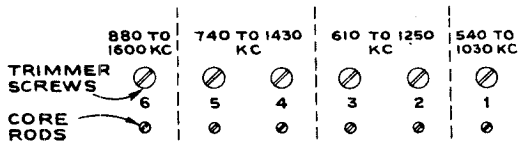
The procedure is as follows:

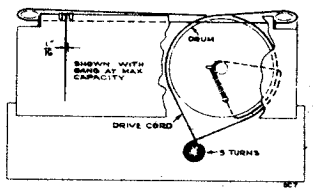
1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range switch to the broadcast position and manually tune in the first station on the list.
3. Turn range switch to push-button position and press in the left-hand button.
4. Adjust No. 1 oscillator core to receive the first station. To secure the best adjustment, rotate the antenna for least pickup, and adjust core for peak output.
5. Adjust No. 1 antenna trimmer capacitor for peak output on the first station.
6. Proceed in the same manner to adjust for the remaining stations.

On the 880 to 1,600 kc push-button, the higher frequency stations may be received with osc. core either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

NOTE: Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

SERVICE HINT:—If unable to reach 550-540 KC on No. 1 push button—Connect a Stock No. 33111 Capacitor-Ceramic-33 mmf across L19 (between switch contact which connects to high side of L19, and switch frame).





STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC-604
36342	Board—"Antenna-Ground" board
38368	Capacitor—Adjustable, 50-350 mmfd. (C5)
60954	Capacitor—Ceramic, 56 mmfd. (C17)
38801	Capacitor—Mica trimmer, comprising 3 sections of 8-80 mmfd. (C7, C8, C10)
39628	Capacitor—Mica, 100 mmfd. (C3, C19, C20, C28)

37877	Capacitor—Electrolytic, 16 mfd., 450 volts (C21)
38788	Coil—Antenna coil, "C" band (L4, L5)
38787	Coil—Oscillator coil (L7, L9)
38800	Condenser—Variable tuning condenser (C1, C9)
70342	Control—Volume control and power switch (R16, S8)
32634	Cord—Drive cord (approx. 43" overall length)
12006	Core—Adjustable core and stud assembly for I.F. transformer
35788	Core—Adjustable core and stud for oscillator coil
38359	Cup—Oscillator coil mounting cup
38790	Drum—Drive drum
35870	Indicator—Station selector pointer
28452	Plate—Bakelite mounting plate for electrolytic capacitor
36333	Plate—Dial back plate complete with pulleys
38832	Plug—Pin plug for loop lead
30868	Plug—2 contact female plug for motor cable
12493	Plug—5 contact female plug for speaker cable
32641	Plug—3 prong male plug for selector switch cable
32289	Pulley—Drive cord pulley
11565	Resistor—15 ohms, ½ watt (R24)
70542	Resistor—270 ohms, 4 watt (R23)
34766	Resistor—1000 ohms, ½ watt (R4, R6)
30654	Resistor—1500 ohms, ½ watt (R3)
38829	Resistor—Resistor and coil assembly, 10,000 ohms (R2, L3)
70541	Resistor—12,000 ohms, 4 watt (R11)
30409	Resistor—27,000 ohms, ½ watt (R15, R25)
30685	Resistor—33,000 ohms, ½ watt (R7)
30147	Resistor—39,000 ohms, ½ watt (R18)
30787	Resistor—47,000 ohms, ½ watt (R1, R5)
30651	Resistor—270,000 ohms, ½ watt (R9, R12, R14, R17)
11988	Resistor—390,000 ohms, ½ watt (R20, R21)
30648	Resistor—470,000 ohms, ½ watt (R13)
30653	Resistor—560,000 ohms, ½ watt (R22)
30649	Resistor—2.2 megohm, ½ watt (R8, R10, R19)
38803	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
33514	Socket—Phono input socket
31251	Socket—Tube socket
31418	Spring—Drive cord tension spring
12007	Spring—Retaining spring for adjustable core and studs
38802	Switch—Radio-phono and tone control switch (S5, S6)
38805	Switch—Range switch (S1, S2, S3, S4)
31380	Transformer—Power transformer—105-125 volts, 50/60 cycle (T1)
35636	Transformer—First I.F. transformer (L10, L11, C19, C20)
35790	Transformer—Second I.F. transformer (L12, L13, C25, C26)
35969	Washer—"C" washer for tuning knob shaft

36461	Button—Plug button
38375	Button—Push button
38684	Capacitor—Trimmer, 2-20 mmfd. (C2)
36424	Capacitor—Mica trimmer comprising 1 section of 10-160 mmfd., 2 sections of 25-250 mmfd., 2 sections of 50-400 mmfd., and 1 section of 100-540 mmfd. (C40, C41, C42, C43, C44, C45)
36462	Clamp—Dial clamp
X1609	Cloth—Grille cloth for Mahogany cabinet
X1610	Cloth—Grille cloth for Walnut cabinet
38579	Coil—Loop primary coil (L2)
38315	Coil—P.B. oscillator coil—high frequency side (L14, L15, L16)
37638	Coil—P.B. oscillator coil—low frequency side (L17, L18, L19)
35871	Core—Adjustable core and stud for P.B. oscillator coil
70547	Cover—Compartment lamp lead cover
39013	Decal—Control panel decal
35392	Decal—Trade mark decal (RCA Victor)
70575	Decal—Trade mark decal (Dog)
39011	Dial—Glass dial scale
36327	Escutcheon—Dial escutcheon—less dial
38376	Escutcheon—Push button escutcheon—less buttons
71003	Grille—Metal grille
39352	Hinge—Cabinet door hinge
30698	Hinge—Cabinet lid hinge
13103	Jewel—Pilot lamp cap
71002	Knob—Cabinet door knob
35814	Knob—Tone control, range switch, volume control, or tuning knob
5117	Lamp—Compartment lamp
11765	Lamp—Dial lamp
70544	Loop—Antenna loop complete (L1, L2, C2)
34317	Marker—Station marker
70546	Mounting—One (1) set of hardware for mounting record changer consisting of four (4) upper and four (4) lower springs and four (4) clamp nuts
37800	Shade—Lamp shade
36422	Socket—3 contact female for selector switch cable and loop leads
30900	Spring—Retaining spring for control knobs
34053	Spring—Retaining spring for push button
71001	Spring—Spring for L.H. cabinet lid support
70999	Spring—Spring for R.H. cabinet lid support
71000	Support—Cabinet lid support—L.H.
70998	Support—Cabinet lid support—R.H.
70545	Support—Loop support complete with mounting brackets and spring
38575	Switch—Selector switch (S14, S15, S16, S17, S18, S19, S40, S41, S42, S43, S44, S45)

RCA MFG. CO.

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the full size calibration scale printed in this service note can be used for reference.

Using Tuning Dial.—

1. Remove the dial glass from the cabinet.
2. With gang at full mesh the pointer should be set to a point (1/16) inch to the left of the reference mark at the left hand end of the dial backing plate.
3. Place the glass dial under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the glass dial in place.

Using Dial Scale Printed In This Service Note.—

Follow the procedure above, substituting the dial scale printed in this service note for the glass dial in the cabinet.

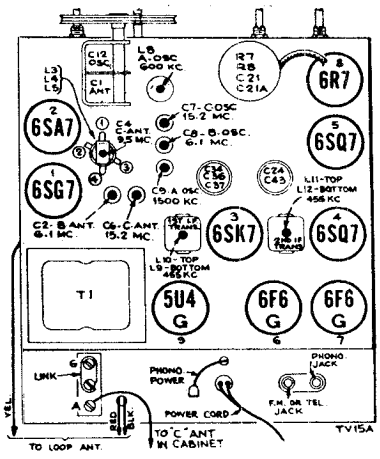
"C" Band Reception.—For best reception on "C" band with an outside antenna, adjust the trimmer screw of C4 on the antenna coil. Turn screw carefully with an insulated screwdriver (RCA Stock No. 31031) while the receiver is tuned to a station in the 31-meter band. If returning to internal antenna at any time, close the link on the center terminal and readjust "C" band antenna trimmer (C4) for best reception on 31-meter band.

For additional information, refer to booklet, "RCA Victor Receiver Alignment."

Steps	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	"A" Band 540 kc	L12, L11 (2nd I-F Trans.)
2	1st Det. grid in series with .01 mfd.			L10, L9 (1st I-F Trans.)
3	Yellow loop lead in series with 200 mmf. (link closed)	1,500 kc	"A" Band 1,500 kc	C9 (osc.)
4		600 kc	"A" Band 600 kc	L8 (osc.)
5		Repeat steps 3 and 4		
6	Ant. terminal in series with 47 mmf. (link closed)	6.1 mc	"B" Band 6.1 mc	C8 (osc.)* C2 (ant.)
7		15.2 mc	"C" Band 15.2 mc	C7 (osc.)* C6 (ant.)
8		9.5 mc	"C" Band 9.5 mc	C4 (ant.)
9		Repeat steps 7 and 8		
10	Install and connect chassis in cabinet, with link closed. Tune in a radiated oscillator signal at 1,500 kc and peak the "A" band ant. trimmer C3 (on loop). Rock in L8 for peak output at 600 kc.			

*Use minimum capacity peak if two peaks can be obtained.

Oscillator tracks 455 kc above signal on all bands.

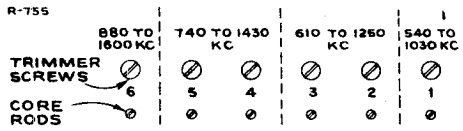


Top View Chassis

Critical Lead Dress

1. Push button, R.F. and oscillator leads should be separated as much as possible to reduce degeneration on push button reception.
2. R.F. choke in plate circuit of 6SG7 should be dressed towards the back apron.
3. Dress green push button lead under clamp and away from "C" band series capacitor.
4. Dress heater leads away from grids and diodes.
5. Dress phono. cables up and away from all wiring.
6. Dress all excess leads from transformer back towards transformer.
7. Keep output plate leads short and dressed close to chassis.
8. Dress green lead from 6SA7 screen to electrolytic down close to chassis.
9. Dress "C" band coil lead from oscillator coil to range switch down toward green lead.
10. Keep yellow loop lead clear of all wiring.
11. Dress ground bus of large electrolytic away from mounting lug.
12. Remove all excess slack from pilot light assembly and dress it close to chassis base away from volume control.
13. Dress oscillator grid capacitor (56 mmfd.) up and away from the screen and plate of 6SA7 socket.
14. A-C leads to "off-on" switch should be kept away from tone control cable to reduce hum.
15. Peaking coil should be dressed away from R-F grid resistor to reduce degeneration in R-F stage.
16. Dress oscillator push button lead in weld clamp on front apron away from 220 mmf. series condenser.
17. Keep all leads away from Phono.-FM jack to prevent audio oscillation and hum. Dress underneath the shield provided.

Push Button Adjustment



The push buttons connect to separate magnetite-core oscillator coils and separate loop circuit trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow about five minutes warm-up period before making adjustments.

The procedure is as follows:

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range switch to the broadcast position and manually tune in the first station on the list.
3. Turn range switch to push-button position and press in the left-hand button.
4. Adjust core rod No. 1 to receive the first station. To secure the best adjustment, rotate the loop for least pickup, and adjust core rod No. 1 for peak output.
5. Adjust trimmer screw No. 1 for peak output on the first station.
6. Proceed in the same manner to adjust for the remaining stations.
7. Repeat adjustments for best results.

On the 880 to 1,600 kc push-button, the higher frequency stations may be received with core rod No. 6 either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

NOTE: Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

SERVICE HINT:—If unable to reach 550-540 KC on No. 1 push button —Connect a Stock No. 33111 Capacitor-Ceramic-33 mmf across L19 (between switch contact which connects to high side of L19, and switch frame).

12493	Plug—Five (5) contact female plug speaker cable
38832	Plug—Pin plug for loop lead
32641	Plug—Three (3) prong male plug for selector cable
39153	Plug—Four (4) prong male plug for tone control cable
32289	Pulley—Drive cord pulley
34766	Resistor—1000 ohms, ½ watt (R3, R10A)
30654	Resistor—1500 ohms, ½ watt (R2)
38808	Resistor—Voltage divider comprising one (1) section of 3000 ohms, 9 watt; one (1) section of 2500 ohms, 4.2 watt; one (1) section of 10 ohms, 0.2 watt; one (1) section of 25 ohms, 0.5 watt; and one (1) section of 145 ohms, 3 watt (R26, R27, R28, R31, R32)
35876	Resistor—Resistor and coil assembly, 10,000 ohms (R1, L13)
36714	Resistor—15,000 ohms, ½ watt (R12, R18)
30492	Resistor—22,000 ohms, ½ watt (R7)
30409	Resistor—27,000 ohms, ½ watt (R18A)
30147	Resistor—39,000 ohms, ½ watt (R21, R3A)
30787	Resistor—47,000 ohms, ½ watt (R4)
30650	Resistor—56,000 ohms, ½ watt (R5, R11)
14138	Resistor—68,000 ohms, ½ watt (R9)
3252	Resistor—100,000 ohms, ½ watt (R8)
30651	Resistor—270,000 ohms, ½ watt (R13, R14, R15, R20)
11988	Resistor—390,000 ohms, ½ watt (R24, R25)
30653	Resistor—560,000 ohms, ½ watt (R30)
30652	Resistor—1 megohm, ½ watt (R17, R29)
30649	Resistor—2.2 megohm, ½ watt (R6, R10, R23)
38803	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
33514	Socket—Phone input socket
31251	Socket—Tube socket
31418	Spring—Drive cord tension spring
12007	Spring—Retaining spring for first I.F. and second I.F. transformers' core and stud and for oscillator's core, coil, and stud
38809	Switch—Radio-phono switch (S5, S6)
38807	Switch—Range switch (S1, S2, S3, S4)
35636	Transformer—First I.F. transformer (L9, L10, C17, C18)
35790	Transformer—Second I.F. transformer (L11, L12, C25, C28)
34539	Transformer—Power transformer 105-115 volts 50-60 cycles (T1)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92513-1K
70574	Cone—Cone and voice coil assembly
31539	Plug—Five (5) prong male plug for speaker
70548	Speaker—12" EM speaker complete with cone and voice coil less output transformer and plugs
37899	Transformer—Output transformer (T2)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
36327	Bezel—Dial bezel less dial scale
38376	Bezel—P.B. bezel less push buttons
36639	Bracket—Pilot lamp bracket
38375	Button—Push button
70556	Bumper—Rubber bumper for record changer tray (2 req'd)
38684	Capacitor—Trimmer, 2-20 mmf. (C3)
36424	Capacitor—Mica trimmer, comprising one (1) section of 10-160 mmf.; two (2) sections of 25-250 mmf.; two (2) sections of 50-400 mmf.; and one (1) section of 100-540 mmf. (C44, C45, C46, C47, C48, C49)
36462	Clamp—Dial clamp
31382	Clip—Mounting clip for P.B. coils
38579	Coil—Loop primary coil (L2)
38315	Coil—P.B. oscillator coil—high frequency (L14, L15, L16)
37638	Coil—P.B. oscillator coil—low frequency (L17, L18, L19)
38405	Control—H.F. tone control (R16)
38402	Control—L.F. tone control and power switch (R22, S-8)
35871	Core—Adjustable core and stud for P.B. oscillator coils
70550	Cushion—Shock absorbing cushion
39015	Decal—Control panel decal
37147	Decal—H.F. tone control decal
37148	Decal—L.F. tone control decal
35392	Decal—Trade mark decal (RCA Victor)
70575	Decal—Trade mark decal (Dog)
39014	Dial—Glass dial scale
X1607	Grille—Grille cloth for Mahogany cabinet
70996	Grille—Metal grille
X1608	Grille—Grille cloth for Walnut cabinet
39368	Guide—Carriage guide—L.H.
39367	Guide—Carriage guide—R.H.
39352	Hinge—Cabinet door hinge
13103	Jewel—Pilot lamp cap
70995	Knob—Record storage compartment door knob
35814	Knob—Tone control, radio-phono switch, range switch, tuning knob, or volume control
11765	Lamp—Dial lamp
70544	Loop—Antenna loop (L1, L2, C3)
34317	Marker—Station marker
70546	Mounting—One set of hardware to mount record changer consisting of four (4) upper and four (4) lower springs and four (4) clamp nuts
30868	Plug—Two (2) contact female plug for motor cable extension
30870	Plug—Two (2) prong male plug for motor cable extension
36422	Plug—Three (3) contact female plug for selector cable and loop leads
31572	Plug—Three (3) contact female plug for power switch cable
38853	Plug—Four (4) contact female plug for tone control cable
70994	Pull—Record changer compartment door pull
70551	Retainer—Tray roller retaining strip—L.H.
70552	Retainer—Tray roller retaining strip—R.H.
70554	Roller—Record changer tray roller
30900	Spring—Retaining spring for control knob
34053	Spring—Retaining spring for push button
70549	Stop—Mechanism tray stop
38575	Switch—Selector switch (S14, S15, S16, S17, S18, S19, S44, S45, S46, S47, S48, S49)
39360	Support—Door support for record changer compartment
70545	Support—Loop support complete with mounting brackets and spring
70555	Tire—Rubber tire for tray roller
70553	Tray—Record changer carrying tray less rollers
2917	Washer—Spring washer to hold roller

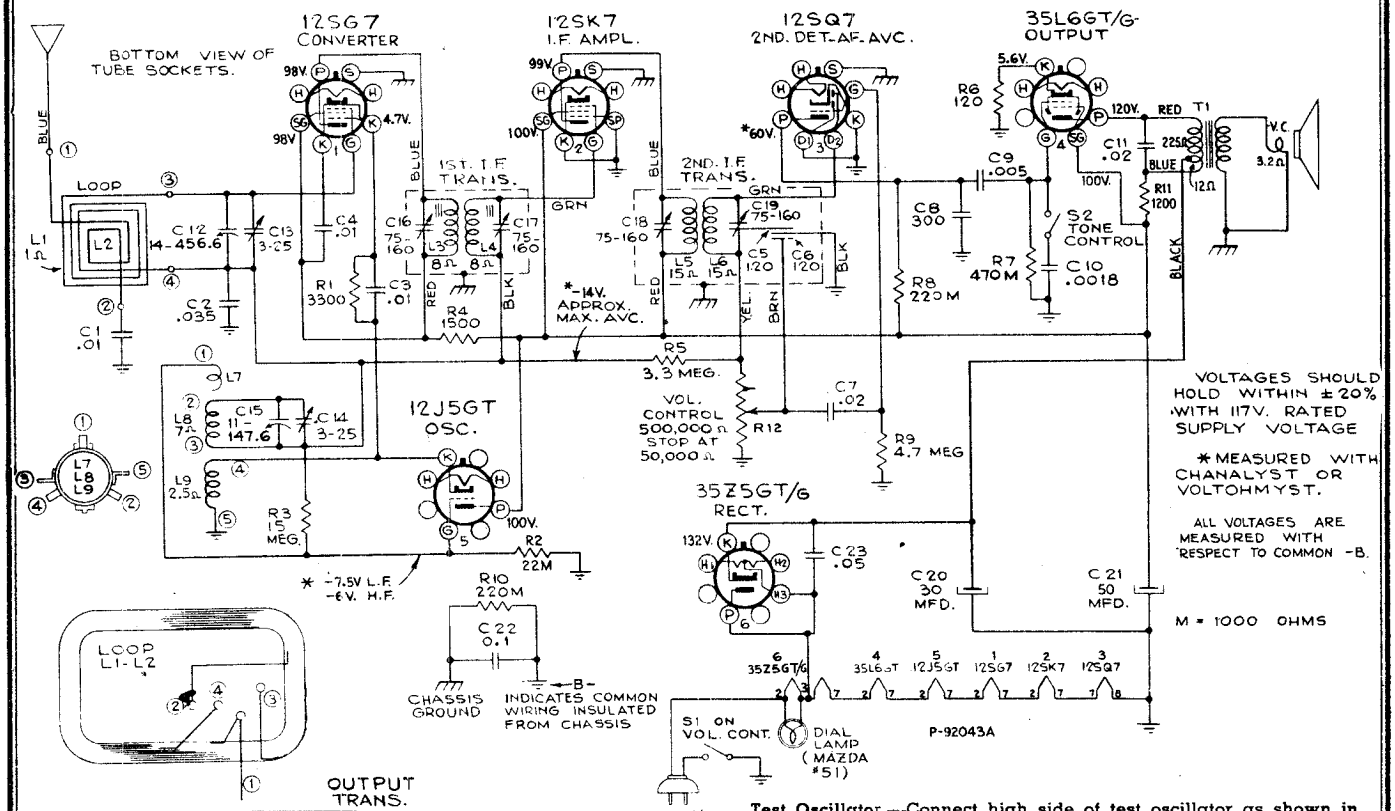
RCA MFG. CO.



Critical Lead Dress

1. Dress output plate bypass capacitor (C-11 .02 mfd.) against chassis.
2. Dress 35L6GT/G plate lead (red) against chassis and away from volume control, leads and terminals.
3. Dress audio coupling capacitor (C-7 .02 mfd.) away from 35L6GT/G heater leads.
4. Dress tone control lead against front apron.
5. Dress 2nd I-F yellow and brown leads away from output plate bypass capacitor (C-11, .02 mfd.) and away from all heater leads.
6. Dress lead to speaker voice coil away from tuning shaft "C" washer.
7. Dress tone control capacitor (C-10, .0018 mfd.) away from oscillator coil.
8. Dress all uninsulated leads away from each other and away from chassis to prevent short circuits.
9. Dress blue and green leads of both IF transformers back in shields leaving exposed lengths as short as possible.

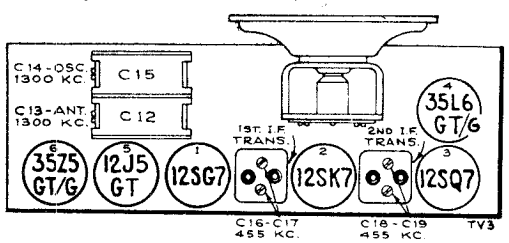
Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mfd. capacitor to common "-B." Keep the oscillator output signal as low as possible to avoid AVC action.

Output Meter.—Connect leads across speaker voice coil. Turn volume control to maximum clockwise, tone control to maximum highs (clockwise).

Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates closed). Adjust indicator pointer to left (max. cap.) mark on dial backing plate.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	Stator of C-12 in series with .01 mfd.	455 kc	Quiet-point 1,600 kc end of dial	C18 and C19 2nd I-F transformer
2				* C16 and C17 1st I-F transformer
3	Ant. lead in series with 200 mmfd.	1,300 kc	1,300 kc	C14 (osc.) C13 (ant.)
4	Repeat step 3.			

* Do not readjust C18 or C19.



Frequency Range ..... 540-1600 kc
Intermediate Frequency ..... 455 kc
Power Output
Undistorted ..... 1.0 watt
Maximum ..... 1.5 watts

31418	Spring—Drive cord tension spring
36228	Switch—Tone switch (S-2)
70411	Transformer—First I.F. transformer (L-3, L-4, C-16, C-17)
70412	Transformer—Second I.F. transformer (L-5, L-6, C-5, C-6, C-18, C-19)
36800	Transformer—Output transformer (T-1)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY
	92510-1
70413	Speaker—5-inch PM speaker, complete
•	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
39953	Back—Cabinet back for Radiola 61-1
70409	Back—Cabinet back for Radiola 61-2
70415	Back—Cabinet back for Radiola 61-3
36890	Clamp—Dial clamp, left hand, for Radiola 61-1 and 61-2
36891	Clamp—Dial clamp, right hand, for Radiola 61-1 and 61-2
X1602	Cloth—Grille cloth for Radiola 61-3
71017	Decal—Control panel decal for Radiola 61-3
70704	Dial—Glass dial scale for Radiola 61-1 and 61-2
70705	Dial—Glass dial scale for Radiola 61-3
37831	Fastener—Push fastener (1 set) for cabinet backs on Radiola 61-1 and 61-2
33006	Feet—Rubber feet for cabinet (4 required)
71016	Knob—Control knob (walnut) for Radiola 61-1
70414	Knob—Control knob (ivory) for Radiola 61-2
36722	Knob—Control knob (walnut) for Radiola 61-3
30900	Spring—Retaining spring for knob

Power Supply Rating
105-125 volts, AC, 50 or 60 cycles, or DC ..... 30 watts

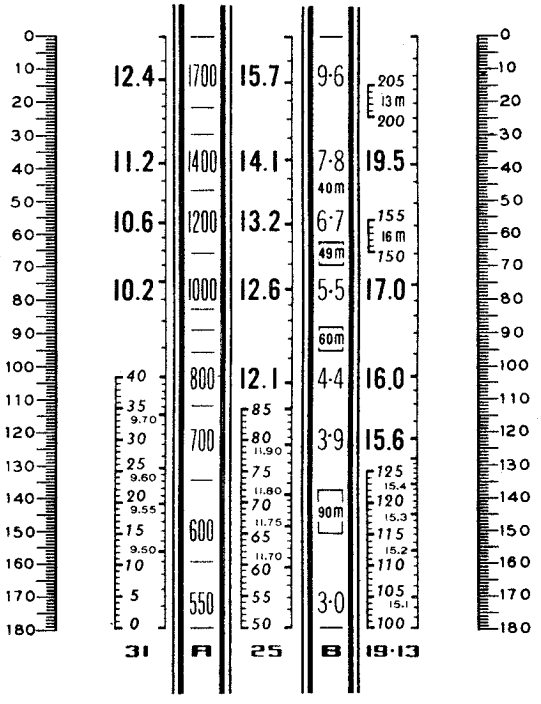
Pilot Lamp ..... Mazda No. 51, 6-8 volts, 0.2 amp.

Tuning Drive Ratio 20:1

Loudspeaker (92510-1)

Type ..... 5-inch PM
V. C. Impedance ..... 3.4 ohms at 400 cycles

Model QU61



Receiver Dial with Calibration Scale

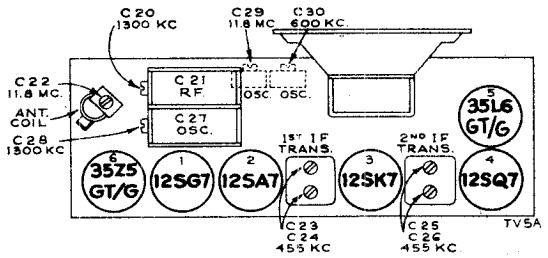
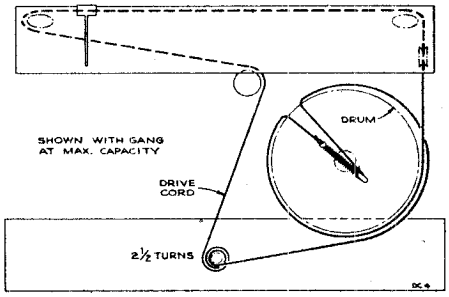
K = 1000
* MEASURED WITH CHANALYST OR VOLTOHMYST.
VOLTAGES SHOULD HOLD WITHIN ± 20% WITH 117 VOLT A.C. SUPPLY.
ALL VOLTAGES ARE MEASURED WITH RESPECT TO -B.
3 POSITION RANGE SWITCH - SHOWN IN POSITION NO. 1 (MAX. CCW.)
NO. 1 - 540 - 1620 KC. MAX. HIGHS.
NO. 2 - 540 - 1620 KC. MIN. HIGHS.
NO. 3 - 8.9 - 12.0 MC. MIN. HIGHS.
P-923069-7

Note: On some sets C31 may be 0.1 mfd. or 0.2 mfd.



Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates fully meshed). Adjust indicator pointer to left (max. cap.) mark on dial backing plate.

Calibration Scale.—The glass tuning dial may be removed from the cabinet and temporarily attached to the dial backing plate.



Critical Lead Dress

1. Dress blue and green leads of both I-F transformers back in shield cans, leaving them as short as possible.
2. Dress R-F plate filter capacitor (C2, 0.1 mfd.) back against rear chassis apron.
3. Dress yellow and brown leads from 2nd I-F away from all other leads.
4. Dress all heater leads next to chassis.
5. Dress capacitor (C13, .01 mfd.) parallel to osc. coil and approximately 3/16 inch from coil.
6. Dress tone control lead and speaker field leads next to chassis and front apron.
7. Dress pilot lamp leads away from ant. coil.
8. Dress leads from loop to ant. coil around rectifier tube towards end of chassis.
9. Dress output plate lead against chassis.

Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mfd. capacitor to common "-B." Keep the oscillator output signal as low as possible to avoid A.V.C. action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum clockwise position, station selector switch to broadcast maximum high position (pos. 1), for broadcast alignment and to position 3 for high frequency band.

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	Pin #8 of 12SA7 in series with 0.1 mfd.	455 kc	Quiet Point at 1,600 kc end of dial	C25, C26 2nd I-F trans.
2				*C23, C24 1st I-F trans.
3	Ant. terminal in series with 220 mmf	600 kc	600 kc "A" Band	C30 (osc.) Rock gang
4		1300 kc	1300 kc "A" Band	C28 (osc.) C20 R-F)
5		Repeat 3 Rocking gang		
6		Repeat 3, 4 and 5 for exact cal.		
7	Ant. terminal in series with 0.1 mfd.	11.8 mc	11.8 mc	C29 (osc.)† Rock gang
8	Ant. terminal in series with 47 mmf.	11.8 mc	11.8 mc	C22 (R-F) Rock gang
9	Repeat steps 7 and 8			

† Use minimum capacity peak if two can be obtained. Check for selection of correct peak by tuning receiver to approximately 10.9 mc where a weaker signal should be received.

* Do not readjust C25 or C26.

Frequency Range

Broadcast ..... 540-1600 kc

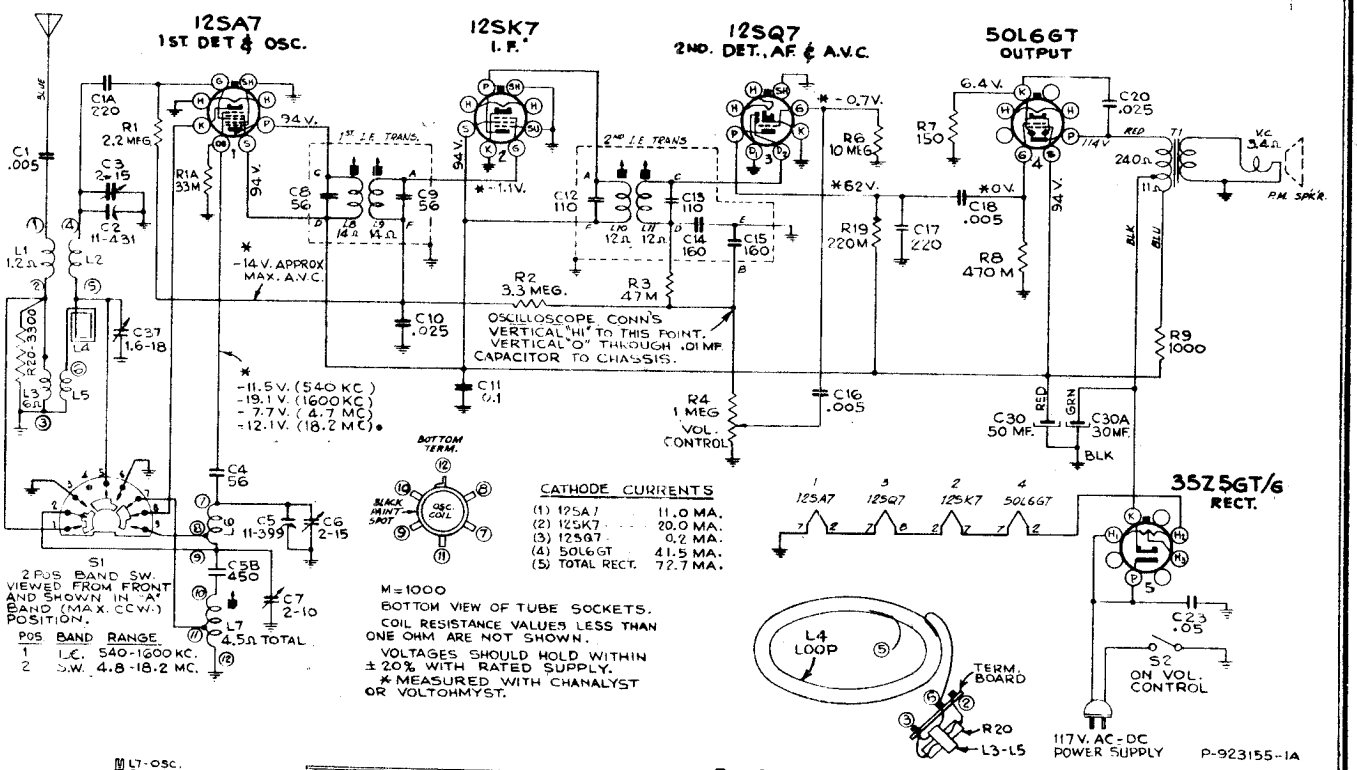
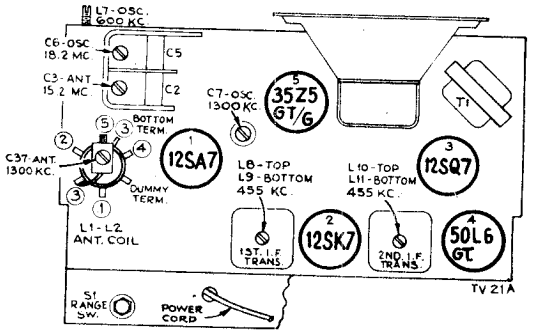
MODELS 61-6, 61-7
Ch. RC-594D

RCA MFG. CO.



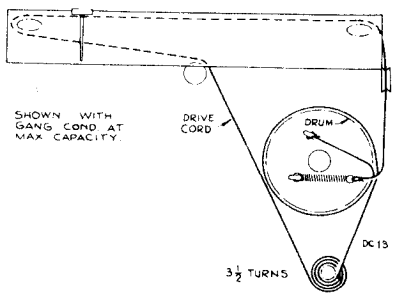


Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown in the schematic drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Calibration Scale.—The glass tuning dial may be removed from the cabinet and mounted above the pointer for easy reference during alignment. The extreme left hand mark of the Standard Broadcast scale must be in line with the left hand mark on the dial backing plate.

Dial Pointer.—With the gang condenser in full mesh the dial pointer should be set to the left hand mark of the Standard Broadcast scale.



Dial Indicator and Drive Mechanism

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator through a .01 mfd. capacitor to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Steps	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust following for max. output—
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	B. C.; 1600 kc quiet point	L11-L10 (2nd I-F Trans.)
2	Stator of gang cond. C2 (rear) through 0.1 mfd.			L9-L8* (1st I-F Trans.)
3	Antenna lead through 300 ohm resistor	18.2 mc	S. W.; gang condenser open	C6 (osc.)**
4		15.2 mc	S. W.; maximum signal rock gang	C3 (ant.)***
5	Antenna lead through 200 mmf. capacitor	600 kc	B. C.; 600 kc	L7 (osc.)
6		1300 kc	B. C.; rock gang at 1300 kc	C37 (ant.) C7 (osc.)
7		600 kc	B. C.; rock gang at 600 kc	L7 (osc.)
8	Repeat steps 6 and 7			

* Do not readjust L10 or L11 when test oscillator is connected to C2.

** Use minimum capacity peak if two peaks can be obtained.

*** Image signal of lesser amplitude should occur at 14.3 mc.

NOTE.—Oscillator tracks above signals on both bands.

Precautionary Lead Dress.—

(1) Dress all spread band oscillator coil leads to clear each other by at least ¼ inch.

(2) Dress toothpick capacitors and range switch leads away from shield plates.

(3) Twist leads from A and E of 2nd I-F transformer and dress close to chassis.

(4) Dress leads to converter socket so that they do not impair flexible mounting.

(5) Dress oscillator grid capacitor C36 and 1st det. grid capacitor C14 apart.

(6) Dress capacitor C23 away from front apron; dress capacitor C24 as close to rear apron as possible.

(7) Dress twisted a-c wiring to power switch away from volume control wiring and components.

(8) Dress excess power transformer leads between transformer bell and back apron.

Frequency Ranges

MODEL QU61
Ch.RC-568B

RCA MFG. CO.

Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic circuit diagram.

Output Meter Alignment.—If this method is used, connect the meter across either voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the rear of the indicator-drive-cord drum which is mounted on the front shaft of the gang condenser.

As the first step in r-f alignment, check the position of the drum, it should correspond to that shown in the Dial Indicator and Drive Mechanism drawing when the gang condenser plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed.

The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

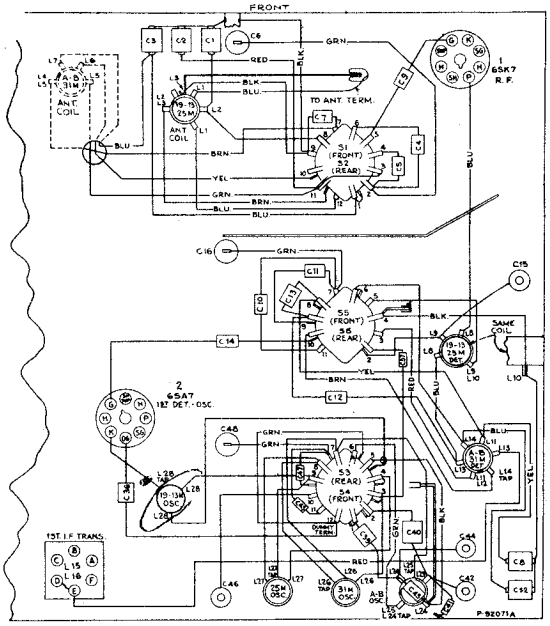
Receiver Dial with Calibration Scale.—To determine the corresponding frequency for any setting of the calibration scale, refer to the drawing.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by retouching the magnetite-core oscillator coil for each band so that these stations come in at the correct points on the dial.

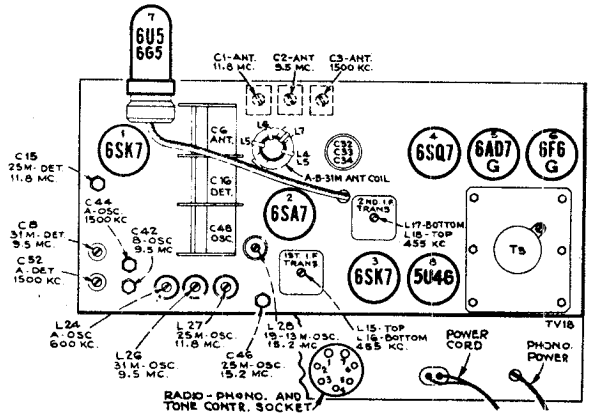
In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal calibrator, or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be retouched so that the stations come in at the correct points on the dial.



R. F. Wiring Diagram (Bottom View)



Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Range Switch	Turn Radio Dial to—	Adjust the following for max. peak output
1	6SK7 I-F grid in series with .01 mfd.	455 kc	"A" band	Quiet point 600 kc end of dial	L18-L17 2nd I-F transformer

11	Repeat steps 9 and 10.				

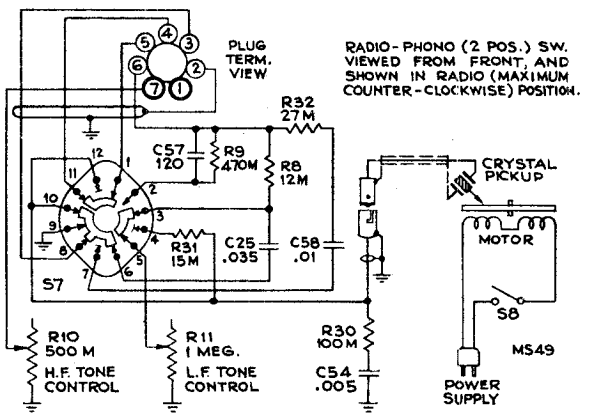
* Use minimum capacity peak if two can be obtained.

** If two peaks can be obtained, use the one obtained when the core screw is farthest out (counter-clockwise).

*** Use maximum capacity peak if two peaks can be obtained.

† Check image to determine that C46 has been adjusted to correct peak by tuning receiver to approximately 14.29 mc (29°) where a weaker signal should be received.

NOTE: Oscillator tracks above signals on all bands.



Radio-Phono. Switch and Tone Control Strip

MODEL QU61
Ch. RC-568B

RCA MFG. CO.

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC-568B
37053	Board—"Antenna-Ground" board
37994	Bracket—Bracket (long) complete with drive cord pulley
37995	Bracket—Bracket (short) complete with drive cord pulley
35642	Calibrator—Drive drum calibrator
37996	Capacitor—Mica trimmer, dual, 2.5-10 mmf. (C8, C52)
37059	Capacitor—Mica trimmer, triple, 2.5-10 mmf. (C1, C2, C3)
12714	Capacitor—Air trimmer, 2-12 mmf. (C15, C42, C44, C46)
33097	Capacitor—Ceramic, 4.7 mmf. (C37)
35646	Capacitor—Ceramic, 6 mmf. (C41)
39604	Capacitor—Mica, 10 mmf. (C13)
39041	Capacitor—Ceramic, 18 mmf. (C43)
70582	Capacitor—Ceramic, 47 mmf. (C5, C11)
39620	Capacitor—Mica, 47 mmf. (C53)
35644	Capacitor—Ceramic, 47 mmf. (C47)
39622	Capacitor—Mica, 56 mmf. (C7, C36)
71291	Capacitor—Mica, 66 mmf. (C4, C10)
35645	Capacitor—Ceramic, 68 mmf. (C45)
39628	Capacitor—Mica, 100 mmf. (C17, C18)
39630	Capacitor—Mica, 120 mmf. (C19, C20, C21)
39636	Capacitor—Mica, 220 mmf. (C9, C12, C14, C51)
70667	Capacitor—Mica, 560 mmf. (C39)
39646	Capacitor—Mica, 560 mmf. (C55)
70687	Capacitor—Mica, 3,000 mmf. (C40)
71007	Capacitor—Tubular, .005 mfd., 1,600 volts (C29, C30)
70606	Capacitor—Tubular, .005 mfd., 200 volts (C23)
70629	Capacitor—Tubular, .007 mfd., 600 volts (C22)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C24)
70631	Capacitor—Tubular, .01 mfd., 600 volts (C28, C31)
70615	Capacitor—Tubular, .05 mfd., 200 volts (C38)
70638	Capacitor—Tubular, 0.1 mfd., 600 volts (C49)
70639	Capacitor—Tubular, 0.25 mfd., 600 volts (C35)
32187	Capacitor—Electrolytic, 8 mfd., 150 volts (C50)
37888	Capacitor—Electrolytic, comprising 1 section of 20 mfd., 450 volts; 1 section of 15 mfd., 450 volts; and 1 section of 20 mfd., 25 volts (C33, C32, C34) (See Note)
37055	Coil—Antenna coil, "A", "B" and 31 meter bands (L4, L5, L6, L7)
37056	Coil—Antenna coil, 25 meter and 19-13 meter bands (L1, L2, L3)
37093	Coil—Oscillator coil, "A", "B" bands (L24, L25)
35624	Coil—Oscillator coil, 19-13 meter band (L28)
35625	Coil—Oscillator coil, 25 meter band (L27)
35626	Coil—Oscillator coil, 31 meter band (L26)
37058	Coil—R-F coil, 25 meter and 19-13 meter bands (L8, L9, L10)
37057	Coil—R-F coil, "A", "B" and 31 meter bands (L11, L12, L13, L14)
37992	Control—Volume control and power switch (R7, S10)
37151	Condenser—Variable tuning condenser (C6, C16, C48)
32634	Cord—Drive cord (approx. 24" overall length)
12006	Core—Adjustable core and stud for I-F transformers
32634	Cord—Indicator cord (approx. 41" overall length)
31259	Core—Adjustable core and stud for 25 meter and 31 meter band oscillator coils and for 19-13 meter band osc. coil
35788	Core—Adjustable core and stud for ABC band oscillator coil
35768	Drum—Drive drum less calibrator
28452	Plate—Bakelite mounting plate for capacitor #37888
30868	Plug—2 contact female plug for motor cable
12493	Plug—5 contact female plug for speaker cable
39858	Pulley—Drive cord pulley
34189	Resistor—Voltage divider, consisting of 1 section of 5,000 ohms, 6 watt; 1 section of 5,000 ohms, 2.5 watt; and 1 section of 195 ohms, 3 watt (R17, R18, R19)
30492	Resistor, 22,000 ohms, 1/4 watt (R4)
30685	Resistor—33,000 ohms, 1/4 watt (R20)
30650	Resistor—56,000 ohms, 1/2 watt (R21)
3252	Resistor—100,000 ohms, 1/4 watt (R13)
14583	Resistor—220,000 ohms, 1/2 watt (R12)
30651	Resistor—270,000 ohms, 1/4 watt (R5)
14983	Resistor—330,000 ohms, 1/4 watt (R14)
30648	Resistor—470,000 ohms, 1/2 watt (R6, R16)
30652	Resistor—1 megohm, 1/4 watt (R1, R2, R22)
30649	Resistor—2.2 megohms, 1/4 watt (R3)
30992	Resistor—10 megohms, 1/4 watt (R15)
14350	Screw—#8-32 square head set screw for drive drum
38842	Shaft—Tuning knob shaft and flywheel
36107	Socket—7 contact socket located on rear apron of chassis
31364	Socket—Dial lamp socket
31251	Socket—Tube socket
34864	Socket—Tuning tube socket
31261	Spring—Retaining spring for 19-13 meter band oscillator coil core and stud and for oscillator coils' core and stud assemblies
31418	Spring—Drive or indicator cord spring
12007	Spring—Retaining spring for I-F transformers' core and stud assemblies
37993	Switch—Range switch (S1, S2, S3, S4, S5, S6)
35636	Transformer—First I-F transformer (L15, L16, C17, C18)
36615	Transformer—Second I-F transformer (L17, L18, C19, C20, C51)
34183	Transformer—Power transformer, 110/125/150/210/240 volts, 50-60 cycle (T3) (For Specification Ratings A and C)
39786	Transformer—Power transformer, 105/120 volts, 25-60 cycle (T3) (For Specification Rating B)
2917	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92520-1K
70574	Cone—Cone and voice coil assembly
5118	Plug—3 prong male plug for speaker
70686	Speaker—12" PM speaker complete with cone and voice coil less plug **NOTE:** If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	SPEAKER ASSEMBLIES 92516-2K
70574	Cone—Cone and voice coil assembly
5119	Plug—3 contact female plug for speaker
31539	Plug—5 prong male plug for speaker
70573	Speaker—12" E.M. speaker complete with cone and voice coil less output transformer and plugs
70688	Transformer—Output transformer (T1) NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
X1601	Baffle—Baffle board and grille cloth
4287	Body—Phono-input cable connector body
36639	Bracket—Lamp bracket
70556	Bumper—Rubber bumper for tray
39630	Capacitor—Mica, 120 mmf. (C57)
70606	Capacitor—Tubular, .005 mfd., 200 volts (C54)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C58)
70614	Capacitor—Tubular, .035 mfd., 200 volts (C25)
30716	Clip—Tuning tube clip
36109	Control—L.F. tone control (R11)
35629	Control—H.F. tone control (R10)
70694	Cushion—Rubber cushion
36156	Decal—HF. tone control decal
36155	Decal—L.F. tone control decal
36074	Decal—Radio-phono switch decal
37839	Decal—Range switch decal
70669	Decal—Triode mark decal
35387	Decal—Volume control and power switch decal
39923	Dial—Glass dial scale
4286	Ferrule—Phono-input cable ferrule and bushing
37998	Frame—Dial frame assembly less tube clip, indicator and dial
70691	Guide—Guide rail—L.H.
70692	Guide—Guide rail—R.H.
70690	Hinge—L.H. cabinet door hinge
70693	Hinge—R.H. cabinet door hinge
36593	Indicator—Station selector indicator
13103	Jewel—Pilot lamp cap
36038	Knob—Radio-phono or range switch knob
35814	Knob—Volume control, tone control or tuning knob
11891	Lamp—Dial lamp
70546	Mounting—One set of record changer mounting hardware consisting of four (4) upper and four (4) lower springs and four (4) clamp nuts.
30868	Plug—2 contact female plug for motor cable extension
30870	Plug—2 prong male plug for motor cable extension
36395	Plug—7 prong male plug for radio-phono cable
30436	Resistor—12,000 ohms, 1/4 watt (R8)
36714	Resistor—15,000 ohms, 1/4 watt (R31)
30409	Resistor—27,000 ohms, 1/4 watt (R32)
3252	Resistor—100,000 ohms, 1/4 watt (R30)
30648	Resistor—470,000 ohms, 1/4 watt (R9)
71151	Retainer—Tray roller retaining strip
71152	Retainer—Tray roller retaining strip
70554	Roller—Changer tray roller
4284	Spring—Phono-input cable connector spring
30900	Spring—Retaining spring for knob
70689	Stop—Mechanism tray stop
39360	Support—Drop support for record changer compartment door
39875	Switch—Radio-phono switch (S7)
70555	Tire—Rubber tire for tray roller
70553	Tray—Record changer carrying tray less rollers
4285	Washer—Phono-input cable insulating washer
2917	Washer—Retaining washer for tray roller

NOTE: #37888 rating is 20-20-20 mfd., 450-450-25 volts.

STOCK No.	DESCRIPTION
	SPEAKER ASSEMBLY 922258-2
71058	Speaker—4" x 6" elliptical P.M. speaker complete with cone and voice coil
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
70471	Back—Cabinet back for 64F1
70472	Back—Cabinet back for 64F2
70475	Clamp—Dial clamps (1 set) for 64F1 and 64F2
70398	Clamp—Dial clamp for 64F3 (2 required)
70476	Dial—Glass dial scale for 64F1 and 64F2
*71166	Dial—Glass dial scale for 64F3
37831	Fastener—Push fastener for cabinet back (1 set)
70474	Knob—Tuning control knob—ivory—for 64F2
70473	Knob—Tuning knob—mottled walnut—for 64F1 and 64F3
*71165	Knob—Volume control knob—ivory—for 64F2
*71164	Knob—Volume control knob—mottled walnut—for 64F1 and 64F3
30900	Spring—Retaining spring for knobs
	POWER SUPPLY RS 1001
*71840	Capacitor—Electrolytic, 2000 mmf., 6 volts (C3, C4)
*71844	Capacitor—Electrolytic dual, 20 mfd., 150 volts (C1, C2)
35069	Fastener—Push fastener for bottom cover
*71838	Reactor—Filter Reactor
*71839	Rectifier—Rectifier complete with mounting bracket
12453	Resistor—27 ohms, ¼ watt (R1)
30788	Resistor—4700 ohms, 1 watt (R2)
*71841	Socket—3 contact female socket
31027	Socket—4 contact female socket for battery cable
37605	Socket—Tube socket
*71837	Transformer—Power transformer, 117 volt, 60 cycle (T1)

Alignment Procedure

Cathode Ray Alignment is the preferable method. Connections for the oscillograph are shown in the diagram.

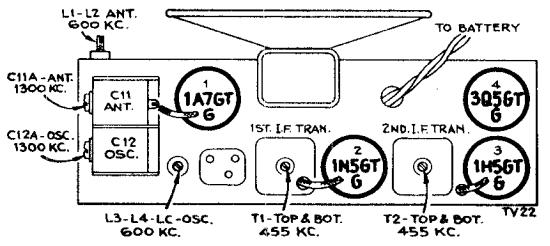
Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis, and keep the output as low as possible to avoid AVC action.

Pre-Setting Dial.—With gang condenser in full mesh, the pointer should be set at the left-hand end dial calibration mark.

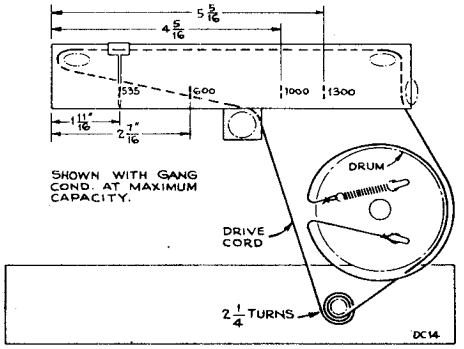
Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust following for maximum peak output
1	I.F. (1N5) grid in series with .1 mfd.	455 kc	Quiet point at the low freq. end of the dial	2nd I.F. trans.*
2	1A7 grid in series with .1 mfd.			1st I.F. trans.
3	Antenna lead (blue) in series with 200 mmf.	1300 kc	1300 kc	C12A (osc.) C11A (ant.)
4		600 kc	600 kc	(Osc.) and (ant.) slugs
5	Repeat steps 3 and 4 for exact alignment.			

*Do not repeat step 1.



Critical Lead Dress

1. Keep output plate capacitor dressed close to the chassis.
2. Keep lead from lug A of second IF transformer down and dressed close around the 1H5 tube socket.
3. Dress 1N5 plate lead close to chassis.
4. Dress C1 down and away from the antenna coil.
5. Dress C3 and C5 away from each other.
6. Dress the lead from 2nd IF transformer to the volume control in the open.



NOTE:—

When using the electrifier, remove the shorting plug on the chassis adjacent to the 1A7GT/G tube and replace it with a similar plug, attached to the electrifier. Also connect the remaining plug attached to the electrifier, in place of the normal battery plug. The receiver will operate in the normal manner, using the same control for turning the set on and off.

NOTE:—

Do not plug electrifier into a DC outlet.

65X1, 65X2

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver colume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be removed from the cabinet and mounted above the pointer for reference during alignment. The extreme left hand mark of the Standard Broadcast scale must be in line with the left hand mark on the dial backing plate.

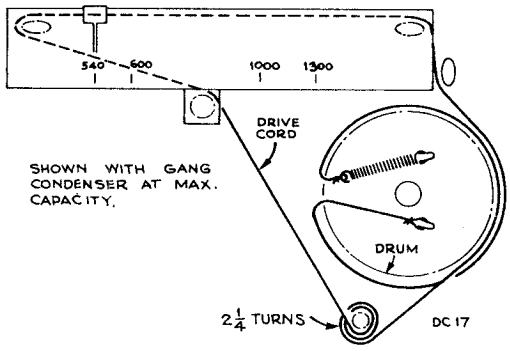
Dial Backing Plate.—In the event that only the chassis is returned for service, the marks on the dial backing plate may be used during alignment; refer to the Dial Indicator and Drive Mechanism drawing for corresponding frequencies.

Dial Pointer.—With the gang condenser in full mesh the dial pointer should be set to the left hand reference mark on the dial backing plate.

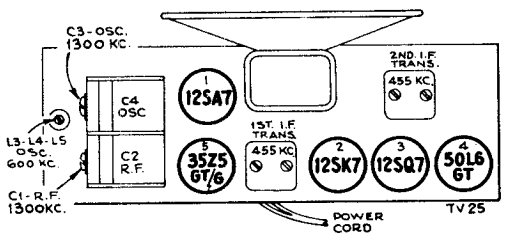
For additional information refer to booklet "RCA Victor Receiver Alignment."

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1,600 kc end of dial	C8 and C9 2nd I-F transformer
2	Stator of C2 through 0.1 mfd.			*C6 and C7 1st I-F transformer
3	Ant. lead in series with 200 mmfd.	1,300 kc	1,300 kc	C3 (osc.) C1 (ant.)
4		600 kc	600 kc "A" Band	L5 (osc.) Rock gang
5	Repeat steps 3 and 4			

* Do not readjust C8 or C9 when test oscillator is connected to C2.



Dial-Indicator and Drive Mechanism



Tube and Trimmer Locations

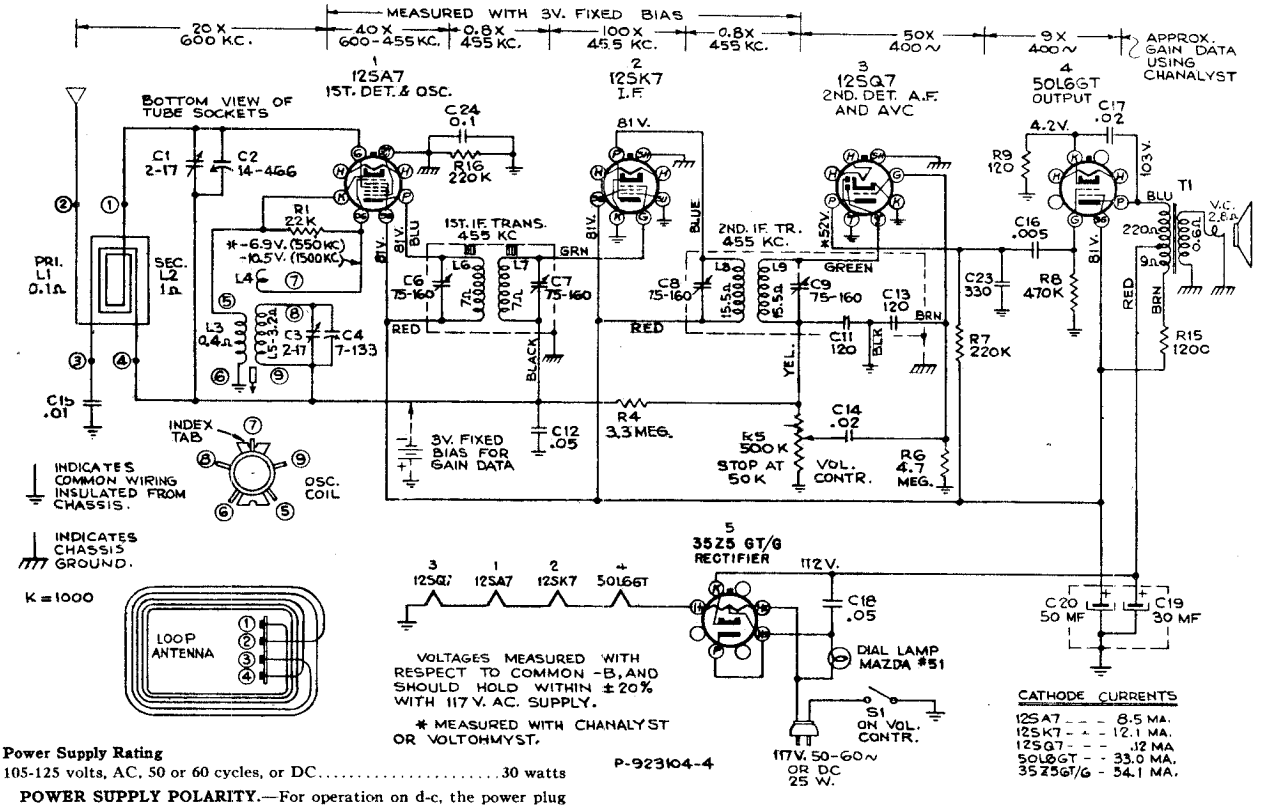
RCA MFG. CO.



Power Supply Rating

105-125 volts, AC, 50 or 60 cycles, or DC.....30 watts

POWER SUPPLY POLARITY.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Critical Lead Dress

1. Dress blue and green leads of both I-F transformers back in shield cans, leaving them as short as possible.
2. Dress all heater leads next to chassis.
3. Dress power cord toward output transformer away from volume control and audio circuits.
4. Dress capacitor (C14) toward switch and parallel to chassis length.
5. Dress capacitor (C16) back against rear chassis apron.
6. Dress capacitor (C17) over and towards 50L6 socket perpendicular to capacitor (C14) and (C16).
7. Dress pilot lamp leads over second I-F transformer and away from tubes.

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1034
70389	Bearing—Tuning knob shaft bearing
39640	Capacitor—Mica, 330 mmf. (C23)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C16)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C15)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C14, C17)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C12, C18)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C24)
70408	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 150 volts and 1 section of 50 mfd., 150 volts (C19, C20)
*70477	Coil—Oscillator coil (L3, L4, L5)
*70463	Condenser—Variable tuning condenser complete with drum (C1, C2, C3, C4)
70322	Control—Volume control and power switch (R5, S1)
32634	Cord—Drive cord (approximately 38")
*70464	Drum—Drive drum
*70469	Indicator—Station selector indicator
11765	Lamp—Dial lamp—Mazda 51
*70468	Loop—Antenna loop (L1, L2)
*70462	Plate—Dial back plate complete with drive cord pulleys less dial
36230	Pulley—Drive cord pulley
30189	Resistor—120 ohms, ¼ watt (R9)
6134	Resistor—1200 ohms, 1 watt (R15)
30492	Resistor—22,000 ohms, ¼ watt (R1)
14583	Resistor—220,000 ohms, ¼ watt (R7, R16)
30648	Resistor—470,000 ohms, ¼ watt (R8)
31417	Resistor—3.3 megohms, ¼ watt (R4)
30931	Resistor—4.7 megohms, ¼ watt (R6)

STOCK No.	DESCRIPTION
*70467	Shaft—Tuning knob shaft
34449	Socket—Lamp socket
37605	Socket—Tube socket—moulded
70390	Spring—Drive cord tension spring
*70465	Transformer—First I.F. transformer (L6, L7, C6, C7)
*70466	Transformer—Second I.F. transformer (L8, L9, C8, C9, C11, C13)
70385	Transformer—Output transformer (T1)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY 922258-1
*70470	Speaker— NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
*70471	Back—Cabinet back for 65X1
*70472	Back—Cabinet back for 65X2
*70475	Clamp—Dial clamps (1 set)
*70476	Dial—Glass dial scale
37831	Fastener—Push fastener (1 set) for cabinet back
*70474	Knob—Control knob—ivory—for 65X2
*70473	Knob—Control knob—mottled walnut—for 65X1
*71821	Knob—Control knob—maroon—for 65X1
30900	Spring—Retaining spring for knob

*THIS IS THE FIRST TIME THIS STOCK NUMBER HAS APPEARED IN PRINT.

	MISCELLANEOUS	
	Bracket — Flywheel mounting bracket	34903
	Board—3-contact terminal board	12716
	Board—5-contact terminal board	34896
	Cord—Dial drive or range shutter control cord	32634
	Coupling—Range switch coupling with set screws	34937
	Detent—Range switch detent plate assembly	34936
	Dial—Transluscent band spread dial complete with hub and set screws	34900
	Dial—Transluscent main tuning dial complete with hub and set screws	34901
	Drum—Large dial drive drum complete	34908
X-1	Crystal—455-kc crystal filter and case	MI-7953
	Flywheel — Tuning flywheel with set screws	34902
	Gear—Brass pinion gear and bearing assembly	34882
	Gear — Split main or band spread condenser drive gear	34881
	Guide, Band indicator shutter guide rods and strap assembly	34899
	Lamp — 6.3 volt dial lamp, Mazda No. 44	11891
	Pulley—Band indicator idler pulley and bracket	34907
	Pulley—Small dial drive pulley and hub with set screws	31271
	Scale — Calibrated stationary vernier scale—less support	34905
	Screw—No. 8-32 set screw for dial drive drum	4669
	Shaft—Dial drive flywheel shaft	34904
	Shaft—Range switch shaft—10¼ inches long	34935
	Shutter—Finished band indicator shutter plate with indicating wire and pilot lamp bracket	34897
	Socket—8-contact phenolic socket	18007
	Socket—8-contact wafer socket	18467
	Spring—Band indicator shutter lift spring	34898
	Spring—Dial drive cord tension spring	32481
	Spring—Triple loop spring used on rear end of band switch shaft	34944
	Support—Vernier scale support and hub assembly	34906
	Knob—Antenna adjuster control knob	34949
	Knob—Bar type control knob (8 used)	34950
	Knob—Main tuning or band spread control knob	34947
	Knob—Range switch control knob	34948
	Mask—Metal window mask plate	34953
M-1	Meter — Carrier level meter complete	34946
	Socket—Pilot lamp socket	34951
	Socket—Pilt lamp socket and clip	34909
	Window—Clear dial window sheet	34952

SPEAKER PARTS, MI-8303 and MI-8303-A (RL-73-1)

	Cone—Speaker cone and voice coil	31310		Socket—3-contact female socket for speaker cable	5119
	Escutcheon—"RCA" escutcheon	13059			
	Plug—3-contact male plug for speaker	5118		Speaker—Speaker unit only less panel	9712

MODELS AR-77,AR-77E,
Late, Revised

RCA MFG. CO.

TECHNICAL SUMMARY

All performance data were obtained on an average receiver. Slight variations above or below these values may be encountered due to practical manufacturing tolerances. A 300-ohm dummy antenna was used in series with the receiver input in making all measurements.

ELECTRICAL CHARACTERISTICS—

Frequency Range (total, 6 bands) ..... 540 to 31,000 kc
- Band 1 ..... 540 to 1,340 kc
- Band 2 ..... 1,340 to 3,300 kc
- Band 3 ..... 3,300 to 5,800 kc
- Band 4 ..... 5,800 to 10,200 kc
- Band 5 ..... 10,200 to 18,000 kc
- Band 6 ..... 18,000 to 31,000 kc

Frequency Stability:

Warm-up Shift, 1 minute to 1 hour, 68° F. Ambient (Average Humidity Conditions) ..... Less than 3.5 kc at 30 mc

Shift with Line Voltage Variation, 105 to 125 volts ..... Less than 1,300 cycles at 29 mc
Shift is proportionally less at lower frequencies

Sensitivity: Input (30% mod.) required for 0.05 watt output ..... Less than 2 microvolts

Signal-to-Noise and Image Ratios:

Band	Frequency KC	Microvolts Input for 2:1 Signal-to-Noise Ratio	Image Ratio
1	540	0.9	50,000
	1,340	1.7	3,900
2	1,340	1.7	5,000
	3,300	1.9	910
3	3,300	1.4	1,000
	5,800	1.2	320
4	5,800	1.4	550
	10,200	1.2	100
5	10,200	1.8	380
	18,000	1.6	88
6	18,000	1.7	60
	31,000	1.0	25

Maximum Undistorted Output (approximate) ..... 3 watts

Power Supply Requirements:

Line Rating—
- Model AR-77 ..... 105-125 volts, 50/60 cycles
- Model AR-77E* ..... 105-130/140-160/195-250 volts, 50/60 cycles

* See "EQUIPMENT" list below for special rack models and optional power packs available.

Power Consumption ..... 70 watts

MECHANICAL SPECIFICATIONS—

Dimensions ..... 20⅛ inches (width) x 10½ inches (height) x 11⅝ inches (depth)

Weight (net) ..... 48½ pounds

EQUIPMENT

Model AR-77: Domestic Model in Cabinet (see "Line Rating") MI-8302D
Model AR-77E: Export Model in Cabinet (see "Line Rating") MI-8302E
Model AR-77: Domestic Model in Cabinet (105-125 v., 25 cycles) MI-8302F
Model AR-77: Domestic Model on Standard 10-15/32-inch Panel (see "Line Rating") MI-8302G
Model AR-77E: Export Model on Standard 10-15/32-inch Panel (see "Line Rating") MI-8302H

Optional Equipment:

- Loudspeaker in Styled Cabinet to match Receiver MI-8303
- Loudspeaker on Standard 10-15/32-inch Panel MI-8303A
- Extended Range Loudspeaker in Console Cabinet MI-8314
- Extended Range Loudspeaker in Wall Type Cabinet MI-8314A
- Panel Kit for Rack Mounting of Model AR-77 (12-7/32-inch Panel) MI-8304
- Panel Kit for Rack Mounting of Loudspeaker (10-15/32-inch Panel) MI-8305
- Power Pack for Model AR-77 or AR-77E (105-125 volts d-c) MI-8307-2
- Power Pack for Model AR-77 or AR-77E (210-250 volts d-c) MI-8307-3
- Power Pack for Model AR-77 or AR-77E (6-volt battery) MI-8308
- Phone Plug MI-6216
- Headphones MI-5803
- A-F Coupling Transformer for 500-ohm line MI-4904

INSTALLATION

POWER SUPPLY—The power supply circuit is integral with the receiver in both the Model AR-77 and the Model AR-77E. At installation, the line voltage and frequency should be determined and checked for conformance to the nominal rating of the receiver. Reference should be made from the MI number on the instrument label on the top of the chassis to the corresponding rating shown in the "Equipment" list. Three power packs are available as accessory items to permit operation on special power supplies.

For connection of an external power pack, there are two terminals on the rear of the chassis connected by a link as shown in Figure 3A. This link should not be disturbed, except for the purpose intended. It is connected in the tube heater supply circuit.

In the Model AR-77E, MI-8302E and -8302H, the power transformer primary may be connected in any of three arrangements to accommodate a wide range of line voltages. Remove the small metal cap from the top of the power transformer and place the "U" shaped connector between the center terminal and that outside terminal marked with a value nearest to the actual line voltage. Thus, if the line voltage were 130 volts, the connector should be placed in the "125 V." position.

If the receiver is to be used for continuous service, especially when unattended, a 3-ampere fuse should be installed in series with the power source.

TUBES—Inspect the chassis before applying power to make certain that all tubes are firmly seated in their sockets and that the grid lead to the RCA-6K8 tube is in place.

ANTENNA—For general use it is recommended that an antenna of the doublet type, either single or double, be used. Connections to either type are shown in the accompanying diagram. Both types will give very good performance in any two amateur bands.

Any of the directive type antennas used for transmission may be satisfactorily employed for reception with this receiver. It will be found that very good results also may be obtained with a single wire antenna from 25 to 75 feet long.

In locations where the antenna transmission line is near power wiring or other sources of noise interference, it is recommended that a coupling transformer such as RCA Stock No. 9813 be connected between the receiver and the antenna transmission line. This transformer, however, is satisfactory only for the 160-, 40- and 20-meter bands. Transmission line such as RCA Stock No. 12430 or Stock No. 9882 is recommended for use with the doublet antennas, the latter being recommended for lengths in excess of 100 feet. The characteristics of these lines are:

Stock No. 12430 (90-foot length) or Stock No. 12429 (45-foot length)

Impedance 100 ohms

DB loss per 100 feet at 10 mc ..... 2 db dry
DB loss per 100 feet at 30 mc ..... 5 db dry
DB loss per 100 feet at 10 mc . 4 db 90% humidity
DB loss per 100 feet at 30 mc . 8 db 90% humidity

Stock No. 9882

Impedance 100 ohms

DB loss per 100 feet at 10 mc ..... 1 db dry
DB loss per 100 feet at 30 mc ..... 2.5 db dry
DB loss per 100 feet at 10 mc. 1.5 db 90% humidity
DB loss per 100 feet at 30 mc. 3.5 db 90% humidity

This transmission line, as well as other RCA antenna materials, may be purchased through RCA Parts Distributors.

The terminal board at the back of the chassis, near the center, contains the connecting terminals for the transmission line (or for the antenna lead-in) and ground. If an ordinary antenna is used, the adjacent transmission-line terminal should be connected to the ground terminal, and the antenna to the other transmission-line terminal.

SPEAKER OR PHONES—This receiver is designed for use with a permanent-magnet dynamic type speaker, having a voice-coil impedance of from 2 to 3 ohms. The RCA Stock No. MI-8303 speaker (see Figure 2) is designed and recommended for the purpose. The terminals for connection to the speaker are shown in Figure 3A.

The RCA Manufacturing Company also produces two deluxe extended range speakers. One, MI-8314, is housed in a walnut cabinet; the other, MI-8314A, is contained in a walnut cabinet for wall mounting.

A jack is provided on the right-hand side of the cabinet, near the front, for plugging in a pair of 600-ohm headphones. The speaker is automatically disconnected when the phones are plugged in.

INSTALLING SHOCK MOUNTS—The following series of operations should be adhered to when installing shock mounts on Communication Receiver, Model AR-77:

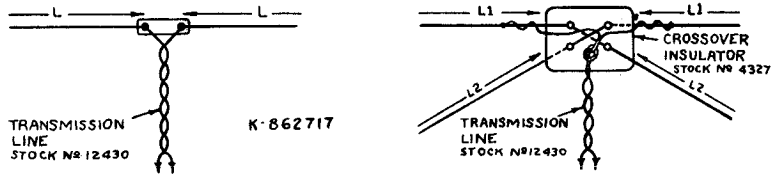
a. Remove all control knobs from the receiver panel.

b. Remove the rear cover grille from the receiver panel.

c. Take out the five screws and washers which are used to attach the receiver to the bottom of the case and withdraw the receiver from the case.

d. Remove the four rubber feet from the bottom of the cabinet by taking out the nuts and screws with which they are attached, enlarge (drill out) the four holes with a 7/64 inch drill.

e. Attach the shock mounts to the bottom of the receiver case using the four ½ inch screws with nuts and lock washers. These screws should be passed through the holes which were drilled out in the preceding operation. Four 1/32 inch spacers are provided, one of which should be placed on each mounting screw between the bottom of the case and the channel brackets of the shock mounts.



SINGLE-DOUBLET ANTENNA

L = 130 feet for 160-Meter (1,900 kc) Band
L = 65 " " 80- " (3,800 kc) "
L = 33 " " 40- " (7,150 kc) "
L = 16 " " 20- " (14,200 kc) "
L = 8 " " 10- " (28,000 kc) "

DOUBLE-DOUBLET ANTENNA

L_1 = 130 feet for 160-Meter Band
L_1 = 65 " " 80- " "
L_1 = 33 " " 40- " "
L_1 = 16 " " 20- " "
L_2 = 65 " " 80- " "
L_2 = 33 " " 40- " "
L_2 = 16 " " 20- " "
L_2 = 8 " " 10- " "

Doublet Antenna Connections

NOTE—In order to facilitate the replacement of these shock mounts, should it become necessary to remove them for receiver servicing at some future date, it is suggested that the position of the mounts be marked on the bottom of the cabinet by drawing the point of a scriber or other pointed implement along the edge of the channel bracket.

f. Replace the receiver in the case and mount it therein, using the five (new) 7/16 inch screws provided for this purpose.

g. Replace the back cover (grille) and the receiver control knob.

RACK PANEL MOUNTING OF RECEIVER—If it is desired to mount the receiver on a rack panel, the necessary panel and supports (MI-8304) are available for this type of mounting. This set of parts includes everything necessary to mount the standard receiver chassis to the rack panel.

The receiver chassis is first removed from the cabinet. For this purpose first remove all knobs from the control shafts. Next remove the perforated metal screen on the back of the cabinet by taking out the five self-tapping screws. Remove the five ¼ inch machine screws underneath the cabinet. Next disconnect the tuning meter on the front panel. The chassis is now ready to be removed from the cabinet. The chassis should be tipped up at the rear just before entirely removing to prevent hitting the two front brackets against the upper angle at the rear of the cabinet.

With the chassis removed, the dial window mask and window should then be assembled to the rack panel. The panel is fastened to the chassis by means of six machine screws. Spacers are placed between the panel and the chassis. The side brackets should then be attached.

One of the headphone jacks should be wired directly to the receiver output terminals. This jack will then allow the receiver output to be monitored in installations where the output of the receiver is connected to a line.

The other headphone jack should be connected exactly like the one on the side of the receiver chassis. This may be simplified in the following manner: It will be observed that the ground and output terminal connections are already connected to the first jack. Jumpers may then be placed between the two jacks for these connections. The remaining connection is to the output transformer primary. This lead should be removed from the jack on the side of the receiver and connected to the jack on the panel. The purpose of this second jack is to connect a pair of headphones and at the same time remove the receiver output from the line. Thus, in a diversity system, one receiver may be easily removed from the combined output and tuned or adjusted without disturbing the others.

A receiver, mounted on a 10 15/32 inch x 19 inch panel, ready to be installed on a rack, is also available. The Model AR-77, MI-8302G, is for use with a power supply of 105-125 volts, 50/60 cycles; and the Model AR-77E, MI-8302H, is for use with 105-130; 140-160; 195-250 volts, 50/60 cycles.

RACK PANEL MOUNTING OF LOUDSPEAKER—The loudspeaker, Stock No. MI-8303, may be converted for rack mounting by purchasing the panel kit, MI-8305, available for this purpose.

©John F. Rider

OPERATION

Before attempting to operate the receiver, this entire section should be carefully studied so that the operator may obtain a general understanding of the various controls and their functions and adjustment. The symbols on the panel used to designate the various controls should be learned with respect to function as shown on Figure 1.

TUNING—In tuning this receiver, the various controls should be approximately set for the class of signal it is desired to receive. Select the frequency band desired by rotating control knob "R" until the proper scale appears in the slot at the upper left of the panel. Before proceeding, adjust the antenna trimmer to maximum for this band (see next paragraph—"Antenna Trimmer"). The frequency calibrations on the main dial scales are correct for tuning, when the bandspread dial is turned to its maximum frequency position only.

The bandspread dial is calibrated for the amateur bands of 10, 20, 40 and 80 meters only. To use the bandspread on these bands, set the main tuning dial at the highest frequency on that band, then tune with the bandspread dial. On the 160-meter band, the calibrations on the main dial are spread sufficiently so that it is not necessary to use the bandspread tuning. For an extremely accurate calibration, set the bandspread dial for a signal of known frequency, and then adjust the main dial until the station is tuned in. When this position has been obtained, note the setting of the arbitrary scale with its vernier index, on the main dial.

For commercial operation, or bands other than Amateur, the arbitrary scales should be used on the main tuning and bandspread dial. If the bandspread is not used, it should be left at the high frequency end of its range and then the main dial calibration is correct.

Curves may be plotted, giving arbitrary scale readings versus frequencies, on any band, by observing the readings on the arbitrary scales for a number of stations of known frequency on the same band, and working them on a suitable graph or chart.

ANTENNA TRIMMER—Before tuning on any frequency range, the antenna trimmer should be adjusted for maximum performance on that band. This control may be adjusted by tuning for maximum background noise. Occasionally it is desired to test a signal that seems out of place, to see whether or not it is a fundamental signal or an "image."

When adjusting the antenna trimmer, if the maximum signal point coincides with the point of maximum background noise, the signal is a fundamental. If the control does not affect the signal strength, or if it is maximum at some other point, the signal heard is an "image."

CRYSTAL SELECTIVITY SWITCH—For general operation while tuning, it is recommended that the crystal switch be in the "OFF" position. After the main tuning dial has been set at the desired point, the crystal may be placed in the circuit while tuning over the bandspread range. Crystal selectivity positions 1 and 2 should be used for phone or modulated signal reception and 3, 4 and 5 for CW telegraph reception.

It will be noticed that when tuning in a modulated signal with the crystal in, the speaker volume is greater on either side of the point which gives the maximum tuning meter indication. The reason for this is that the carrier voltage controls the gain of the receiver by means of the A.V.C. circuit, and if the carrier frequency is detuned slightly from resonance, the gain of the receiver increases so that part of the side band frequencies are amplified very much more than they are when the carrier is tuned to exact resonance. This is characteristic and normal for receivers with this degree of selectivity and provided with A.V.C. Care should be taken to tune the receiver for a maximum meter indication. Very much better results will be obtained. The background noise and adjacent channel interference will be materially reduced.

This receiver has been designed to have a selectivity characteristic which is slightly flat at resonance when the crystal is out, so that better fidelity of reception may be enjoyed when interference conditions permit. It is therefore likely that when the crystal is placed in the circuit, slight retuning may be necessary. This is due to the fact that exact tuning is much more necessary when using a sharp I-F circuit than when using a broad circuit.

CRYSTAL PHASING CONTROL—There is a normal or "neutral" position for this control, in which position it should be set for all normal reception. To locate this position, set the Crystal Selectivity Switch on position 3 or 4, and, using high gain with no incoming signal, adjust the phasing control for minimum noise. This control should be changed from this position only when a strong signal is producing a heterodyne action with the desired signal. In this case, the control should be adjusted for a minimum heterodyne effect.

VOLUME AND SENSITIVITY CONTROLS—For phone reception the sensitivity control should be set at maximum and the audio volume control used to obtain the desired volume. For CW telegraph reception the audio volume control should be set at three-fourths to maximum position and the desired volume obtained by adjustment of the sensitivity control.

NFB-AVC-BFO SWITCH—These letters stand for "NEGATIVE FEED-BACK," "AUTOMATIC VOLUME CONTROL," "BEAT FREQUENCY OSCILLATOR." The "NFB" position places the compensated negative feedback in the audio circuits, resulting in an increase in fidelity. This is useful for tests in voice transmissions and for entertainment use such as on broadcast reception. When using this position the volume control must be advanced slightly. This position is not recommended for other forms of reception.

The A.V.C. is in operation on both the "NFB" and "AVC" positions of this switch.

The A.V.C. is "OFF" when the switch is in the "BFO" position. This position connects the beat-frequency oscillator.

BFO FREQUENCY CONTROL—This control is provided to secure any desired audio beat frequency, for the reception of CW code signals. It should be set slightly off the central position, in normal use. The exact position may be found by experiment. With the crystal switch "OFF," the desired beat note may be obtained by tuning the receiver. However, in conditions of interference, when the crystal filter is used, the receiver must first be tuned to the desired signal, regardless of the beat frequency produced. If the beat note is not satisfactory, it may be changed with the BFO control. In other words, first tune for maximum signal strength, then adjust for the desired audio pitch.

When tuning in the same direction (that is, going from the high frequency to the low frequency end of the band, or vice versa), ALL signals will be changing in pitch in the same direction when resonance is reached. That is, the pitch will either be increasing or decreasing, depending on whether the BFO control is on one side or the other side of I-F resonance. It does not matter on which side the BFO control is placed, the CHANGE OF PITCH should be noted when tuning. If the change of pitch is opposite to that known to exist when passing through resonance, the signal is an audio image. Never try to receive an audio image. The signal can be made much stronger by tuning to the other side of zero beat.

NOISE LIMITER LEVEL CONTROL—When starting to tune the receiver, this control should be set in the "OUT" position, or advanced about one-quarter to three-quarters of the way in the counter-clockwise direction. Should external noise conditions interfere with reception, this control may be advanced as necessary, avoiding distortion of the signal. This control may be found especially helpful for reducing certain types of interference encountered on the 10-meter band. For CW reception with the noise-limiter, the sensitivity control should be advanced, and the volume control reduced until limiting action occurs.

TRANSMIT-RECEIVE SWITCH—This switch opens the plate circuits of the receiver on the transmit position and shorts the two terminals on the antenna terminal strip (shown in photograph Figure 3A), which may be connected to a relay for operation of the transmitter.

In addition, terminals J2 and J3 are provided so that, if desired, the plate circuit of the receiver may be opened by a transmitter switch. Note that these terminals are at plate potential.

TUNING OR "S" METER ADJUSTMENT—The "S" meter should normally give a low scale reading when no signal is being received. To adjust this meter, tune the receiver to a point free of signals, turn the sensitivity control to maximum, switch in A.V.C. switch crystal "OUT," have antenna trimmer turned off resonance, and then adjust the potentiometer R20 at the back of the receiver as shown in Figure 3A until the meter pointer just coincides with the mark at the low end of the scale. The meter will usually rise slightly when the antenna trimmer is tuned to resonance.

The calibration of this meter is arbitrary, since no standard has been set for conversion of the "S" units to microvolts. However, in this receiver, "S1" is equivalent to approximately 0.5 microvolt input to the receiver. Each unit above this is 6 db up to "S9" Thus, "S2" is equivalent to 1 microvolt, "S3" to 2 microvolts. Above "S9" the meter is calibrated to 40 db, which would be equivalent to 12,800 microvolts.

For CW telegraph reception, the "S" meter provides a visual indication of the position of the sensitivity control.

BREAK-IN OPERATION—Break-in operation may be obtained on CW telegraph operation by connecting a separate antenna to the receiver. A single wire antenna or a doublet tuned to a different band than that on which the transmitter is working is recommended. If a doublet antenna tuned to the transmitter frequency is used, sufficient voltage may be induced in the receiving antenna to damage the receiver.

DIVERSITY RECEPTION—Two or three of these receivers may be connected together for diversity reception of modulated signals, with no additional equipment necessary. Each receiver must be provided with a separate antenna in the usual manner. The A.V.C. terminal on the back of the receiver, shown in Figure 3, is connected inside the receiver to the A.V.C. circuits. This terminal must be connected to the corresponding terminals of the No. 2 and No. 3 receivers. The receiver outputs should all be connected in parallel. Note that one of the output terminals of this receiver is at ground potential.

FOR CONNECTION TO A TELEPHONE LINE—It is recommended that a transformer such as RCA type MI-4904 be used. The connections to the type MI-4904 transformer should be made as follows:

1. Connect the output terminals of one or more Model AR-77 receivers in parallel to terminals No. 4 and No. 41 of the transformer.
2. Connect the 500-ohm line to transformer terminals 1A and 3B.
3. Connect a jumper between transformer terminals 1B and 3A.
4. Connect a 500 to 600 ohm, ½ to 1-watt resistor across the 500-ohm line, or across terminals 1A and 3B.

Connecting a pair of headphones in the jack on each receiver will disconnect it from the combined output so that the tuning or other adjustments may be checked. Obviously, the audio volume control on each receiver should be set to approximately the same level. For CW telegraph diversity reception, it is recommended that a combining and tone-keyer unit be used.

©John F. Rider

MAINTENANCE

CIRCUIT DETAILS AND FEATURES—In reading the following discussion of the electrical circuit, reference should be made to the schematic diagram, Figure 5.

INPUT COUPLING—The antenna coupling system is designed to provide optimum coupling from transmission lines of 50 to 500 ohms, or from conventional antenna and ground systems. The coupling coils are balanced to ground and may be connected directly to a balanced transmission line. An antenna trimmer capacitor adjustment is provided on the front panel to insure first circuit resonance with any antenna system.

RADIO-FREQUENCY AMPLIFIER—The r-f amplifier is designed to provide as much selectivity as possible ahead of the first detector. The amplification is adjusted to provide optimum signal to noise ratio by making noise contributions of circuits following the first tube negligible in comparison with the noise contributed by the first r-f grid circuit. A uniform amplification is obtained over all frequency ranges. On the two highest frequency ranges the oscillator frequency is placed below the signal frequency. This gives better freedom from image signals in the higher frequency amateur bands.

BAND SPREAD—Band spreading is accomplished by means of a capacitor gang having sections of capacity suitable for each amateur band. The sections of this capacitor are connected by the band switch so that on each amateur band, proper size of capacitor is used to spread the band over the entire tuning dial. The dials are directly calibrated in frequency.

R-F HETERODYNE OSCILLATOR—The r-f oscillator circuit is of the tuned-grid type with plate circuit feedback. A voltage regulator is used to stabilize the plate voltage. Temperature changes are compensated for by a special capacitor. This capacitor is composed of a small bi-metal plate, which is adjusted to have a temperature coefficient which will compensate for all other circuit changes. This type of temperature compensation was found to be quite satisfactory since the circuit minimum and maximum capacities are the same on the higher frequency ranges. That is, the temperature coefficient of this compensating capacitor is adjusted at the factory for best results on the high frequency end of the highest frequency range. The compensation is then near optimum on the high frequency end of each band. As the receiver is tuned from the high frequency end to the low frequency end of each band more tuning capacity is added and less compensation is needed. Since the capacity of the compensating capacitor is small compared to the tuning capacitor, less compensation results. Thus, a fairly uniform temperature characteristic is obtained over a very wide frequency range.

INTERMEDIATE-FREQUENCY AMPLIFIER—As may be seen from the schematic diagram, two stages of i-f amplification are used. A crystal filter is placed between the first detector and the first intermediate amplifier. This filter is adjustable by means of a control on the front panel and provides five positions of selectivity. A crystal phasing control of the usual type is also provided on the front panel. The intermediate frequency is 455 kc.

BEAT-FREQUENCY OSCILLATOR—The BFO second heterodyne oscillator used for CW reception is a separate pentode. The coupling to the second detector is just sufficient to provide suitable heterodyne action. A panel control is provided for changing the frequency a small amount so that any desired audio beat-frequency may be obtained.

AUTOMATIC VOLUME CONTROL AND "S" METER—The A.V.C. circuit is a simple diode rectifier. Referring to the schematic diagram, Figure 5, the received signal carrier produces a voltage across R-38 which is filtered by R-36 and C-72 and applied to the control grids of the r-f and i-f amplifiers. The "S" meter is connected in the cathode circuit of the first i-f tube and thus records changes in plate current caused by changes of A.V.C. voltage applied to the grid. This type of "S" meter circuit provides the desired wide range and the greater portion of the scale is approximately linear with respect to db input.

NOISE LIMITER—A noise limiter is provided in the second detector circuit. The limiter is manually adjusted. This provides best limiter action since noise voltages cannot increase the limiter bias.

It has been found that noise such as that produced by the ignition systems of automobiles may have an effective value in excess of that of a weak signal. This is particularly true on the 10-meter band. In order to be effective, the limiter must have a bias or "gate opening" of not more than twice the signal carrier amplitude. If this "gate opening" is provided by the signal such as is done in present automatic noise circuits, the noise voltage, if it has a higher effective value than the signal, will open the "gate" to such a high value that the limiter circuit is ineffective. The action of the noise circuit in this receiver is such as to make signals readable which are below the effective noise voltage.

Referring to the schematic diagram, Figure 5, the signal and noise voltages appear across R-32 and the noise peaks alone appear across R-33, since the bias applied to R-31 by the potentiometer R-34 prevents this diode from operating with the signal voltage. The sum of these voltages (across R-32 and R-33) are applied to the audio amplifier. It is apparent that the noise peak voltage across R-32 is out of phase or opposed to that across R-33. The "balance" of this circuit is adjusted by potentiometer R-33. The potentiometer R-34 is the front panel bias control.

SERVICE—This receiver has been carefully adjusted and aligned by the manufacturer before shipment, and should maintain its adjustments over a considerable period of time. It is recommended that any major adjustments or repairs be made by a competent service man.

TUBES—In a receiver which is used quite consistently, the first trouble which is likely to occur is that of deficient vacuum tubes. Usually the symptom of deficient tubes is a noticeable decrease in the sensitivity of the receiver. If the receiver will operate on all bands, but with low sensitivity, the tubes should be removed and checked. The tube locations are shown on the label on the large metal shield on top of the chassis.

BAND CHANGE SWITCH—After a long period without being operated, the band change switch may become noisy or inoperative because of dust or oxide film on contacting surfaces. In some cases, normal operation may be restored by rotating the switch a number of times. If it is found impossible to clean the switch sufficiently by rotation, the defective switch section must be located and replaced. The receiver should be removed from the cabinet and operated in a position such that the switch sections are accessible.

With the switch in the defective position, a slight movement of each section with an insulated screwdriver will usually determine the defective section.

To remove a switch section it will first be necessary to remove the switch shaft. The antenna trimmer control shaft must also be removed in order to unsolder the leads on the tuning capacitor. After all leads are disconnected the entire coil and switch assembly may be removed by taking out the three screws holding the assembly to the chassis.

TEST OF CIRCUIT ALIGNMENT—Under normal operating conditions the r-f amplifier and oscillator circuits should remain in line. If, however, it is found desirable to check the alignment of these circuits, the following test should first be made. Disconnect the antenna or transmission line and connect a 50- to 300-ohm carbon resistor across the two antenna terminal posts. Connect an output voltmeter to the output of the receiver and connect a 20-ohm resistor across the meter. Turn the sensitivity and volume controls to maximum. The A.V.C. switch should be on the A.V.C. position. The output noise voltage should be at least 0.1 volt, with the antenna trimmer tuned to resonance. The maximum noise voltage is a direct measurement of the sensitivity of the receiver. If the test shows that this voltage is less than 0.1 volt, the circuits should be realigned. First be sure that the decreased sensitivity is not caused by poor tubes. It probably will not be necessary to align all bands; however, the correct procedure for all bands is given below.

ALIGNMENT OF I-F CIRCUITS—Remove the bottom cover plate of the receiver cabinet, tune in a steady outside signal on one of the lower frequency bands with the A.V.C. switch on the BFO position and the crystal filter switch in position 2 or 3. The signal should be tuned for a peak response at the crystal frequency. Do not use too strong a signal. The sensitivity control should be adjusted for approximately 1 volt output. Referring to Figure 5 adjust T-1, L-19, T-2, T-3 and T-4 for a maximum output voltage. The signal should now be detuned approximately 1,000 cycles and adjustments T-1, L-19 and T-2 retuned for a maximum output.

The T-2 adjustment on top of the chassis is sealed with polystyrene cement. Applying a soldering iron to the adjusting screw for a few seconds will soften the cement. The intermediate frequency is 455 kc.

ALIGNMENT OF R-F AND OSCILLATOR CIRCUITS—Under usual conditions, the oscillator frequency will not shift far enough to throw the frequency calibration off, therefore, unless it is found that the frequency calibration is incorrect, the oscillator adjustments should not be changed. In any case, the oscillator circuit should not be changed unless a frequency calibrated test oscillator is available. The following procedure is for the r-f alignment of band No. 1 (540 to 1,300 kc). Tune in a signal near the high-frequency end of the band. (Do not use too strong a signal.) Reduce the sensitivity control until the output is approximately 1 volt. Referring to Figure 6, adjust C-18 and the antenna trimmer control on the front panel for maximum output. Next, tune in a signal near the low frequency end of the band. Adjust L-1 and L-7 for a maximum signal output. The same procedure may be followed for all bands. Make sure that the bandspread tuning is at the high-frequency end of the scale. The bottom cover should be held over the oscillator trimmer capacitors while adjusting the high frequency end of each band, so that when the cover is replaced, the frequency will not shift. The adjustments for each particular band are shown in the table herewith.

Band	R-F Ind.	Det. Ind.	Det. Cap.	Osc. Ind.	Osc. Cap.
540- 1,340 ..	L-1	L-7	C-18	L-13	C-24
1,340- 3,300 ..	L-2	L-8	C-17	L-14	C-23
3,300- 5,800 ..	L-3	L-9	C-22	L-15	C-28
5,800-10,200 ..	L-4	L-10	C-21	L-16	C-27
10,200-18,000 ..	L-5	L-11	C-20	L-17	C-26
18,000-31,000 ..	L-6	L-12	C-19	L-18	C-25

DIAL SHUTTER ADJUSTMENT—If the dial shutters do not line up with the dial calibration, they may be adjusted by means of an idler pulley bracket which adjusts the tension of the cord. By loosening the two screws which clamp the idler pulley bracket to the chassis the bracket may be shifted until the shutter opening lines up with the dial scale.

Another adjustment may be made by loosening the two nuts on adjusting screw fastened to back of shutter. To raise or lower the shutter, adjust the nuts accordingly.

DIAL ADJUSTMENT—Should it become necessary to replace or to tighten the main dial, the reference line at the high-frequency end should be disregarded. The dial should be set so that a reading of 54 is obtained on the arbitrary scale. This should be read through the dial shutter opening, with the range switch on the highest frequency position and the tuning capacitor set at the low frequency end.

NOISE BALANCE ADJUSTMENT—This adjustment is the potentiometer mounted on the right flange of the chassis (R-33). The correct adjustment has been carefully made at the factory and should ordinarily require no further attention. However, in servicing the receiver, in the event that the adjustment is accidentally moved, it may be reset as follows: First tune in a strong modulated signal such as a broadcast station. Next turn the noise control on the front panel all the way clockwise. Now adjust the potentiometer for a minimum signal output. This point will be found to be very sharp. When properly

©John F. Rider

adjusted, the signal output will be quite low until the noise control on the front panel is turned back counterclockwise.

TUBE SOCKET VOLTAGES—If the receiver is found to be completely inoperative, it is likely that a resistor is open-circuited or a capacitor is short-circuited. The bottom cover plate of the receiver cabinet should be removed. The tube socket terminal voltages should be measured and should be approximately the values given in the table below. The tubes should remain in the sockets for this test. A voltmeter having a resistance of at least 50,000 ohms should be used. Place switch on BFO and turn Sensitivity Control to maximum.

TUBE SOCKET VOLTAGES

Tube	Symbol	Cathode to Ground	Screen Grid to Ground	Plate to Ground	Suppressor Grid to Ground	Oscillator Plate to Ground	Heater (A-C) Pin No. 2 to Pin No. 7

RCA MFG. CO.

Frequency Range ..... 540-1,760 kc
Alignment Frequency ..... 1,760 kc (ant., det.)

POWER SUPPLY RATINGS

A-C Rating ..... 105-125 volts, 50-60 cycles, 50 watts
D-C Rating ..... 105-125 volts, 50 watts

POWER OUTPUT (125-volt, 60-cycle supply)

Undistorted ..... 1.0 watt
Maximum ..... 1.5 watts

LOUDSPEAKER

Type ..... 5-inch Electrodynamic
Voice-Coil Impedance ..... 3 ohms at 400 cycles

Alignment Procedure

Reel up the antenna wire, and connect the high side of test-oscillator through an 80 mmfd. capacitor to the antenna terminal on the antenna transformer. Connect low side of oscillator to receiver chassis through a 0.1 mfd. capacitor. Turn gang condenser to minimum (full out), tune oscillator to 1,760 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Keep antenna roll and lead clear of chassis during alignment.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscillator.

Turn pointer, while holding tuning knob, so that the pointer is horizontal and pointing to low-frequency end when the gang condenser is at maximum. Check pointer adjustment on a station.

25-Cycle Operation

For 25-cycle operation, connect a 16 mfd., 150-volt dry electrolytic capacitor (Stock No. 31323) in parallel to C13.

Antenna.—The set is equipped with a 25-foot antenna. Do not connect the antenna to ground. If an outdoor antenna is used, it should not be longer than 100 feet, including lead-in. If it is longer, connect a 100 to 200 mmfd. capacitor in series with the lead-in.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

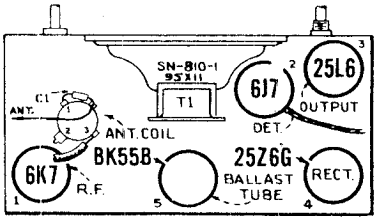
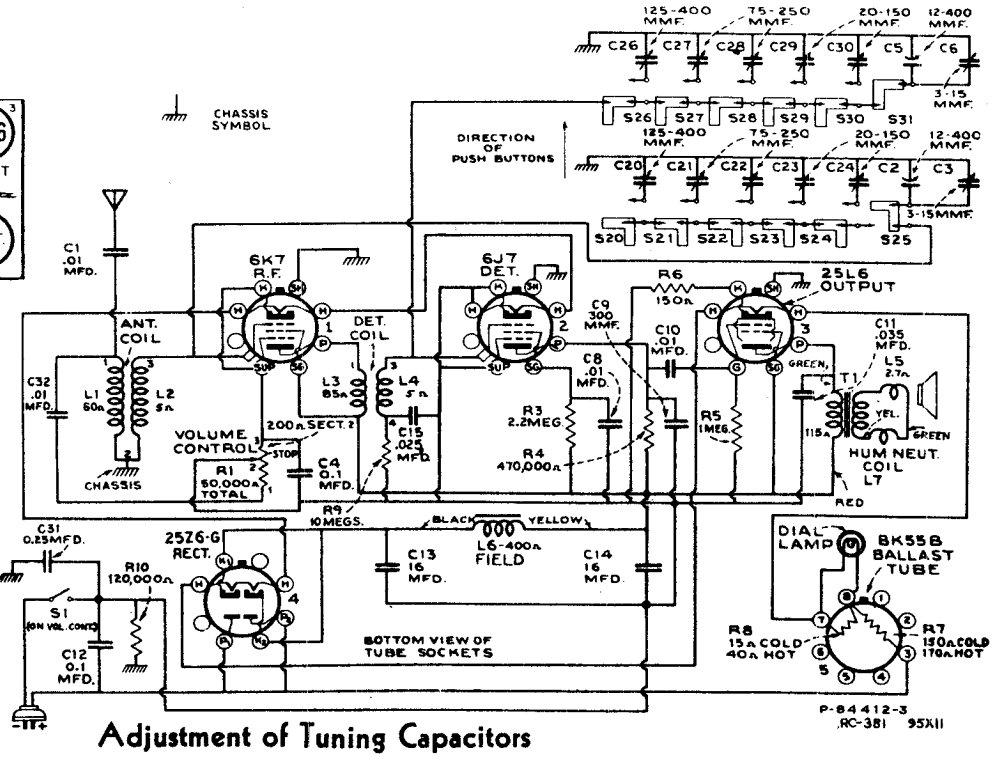
MODEL 95X11

RCA MFG. CO.





Alignment Procedure

Remove chassis from cabinet.

Reel up the antenna wire, and connect the high side of test-oscillator through an 80-mmfd. capacitor to the antenna terminal on the antenna transformer. Connect low side of oscillator to receiver chassis through an .01-mfd. capacitor. Turn gang condenser to minimum (full out), push in the manual-tuning (right-hand) button, tune oscillator to 1,560 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Keep antenna roll and lead clear of chassis during all adjustments.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscillator.

Turn pointer, so that it is horizontal and pointing to low-frequency end when the gang condenser is at maximum. Check pointer adjustment on a station.

Adjustment of Tuning Capacitors

The preferable and quickest method of adjusting the tuning capacitors for five different stations, is to employ a test-oscillator, as described below:

1. Make a list of the desired five stations, arranged in order from low to high frequencies.
2. Determine the correct settings of the test-oscillator for these five frequencies. This is accomplished as follows: Tune in each of the five stations on any standard receiver; zero-beat the test-oscillator against each station, and note the exact setting of the oscillator in each case.
3. Reel up the antenna wire. Connect the high side of test-oscillator through an 80-mmfd. fixed capacitor to the end of the antenna wire. Clip the low side of the oscillator through a 0.1-mfd. capacitor to one of the chassis-mounting screws on the bottom of the cabinet. Tune the oscillator to the previously-determined point for the lowest-frequency station, and adjust for a strong output.
4. Turn the volume control of the push-button receiver full clockwise, and push in the left-hand end button. Using an insulated screwdriver, peak capacitors C20 and C26, at the same time reducing the output of the oscillator in order to secure a sharp peak. (Clockwise adjustment of the capacitors tunes the circuits to lower frequencies, and counter-clockwise adjustment tunes the circuits to higher frequencies. The range of each trimmer is three full counter-clockwise turns from the tight position. Do not unscrew more than three turns.)
5. Push in the second button from left, and adjust C21 and C27 for peak output with the oscillator tuned to the frequency of the second station.
6. Proceed in this manner to adjust each pair of capacitors for the desired frequencies.
7. Final adjustment may be made in actual reception of the stations.

Precautionary Lead Dress

1. Dress Power cord away from detector coil, heater leads close to base, leads from electrolytic close to base and free of grid leads.
2. Dress blue lead from r-f plate to detector coil along front edge of push-button shaft holes. Dress all leads to prevent rubbing against push button shafts.

25-Cycle Operation

For 25-cycle operation, connect a 16 mfd., 150-volt dry electrolytic capacitor (Stock No. 31323) from the cathode of the rectifier tube to chassis. (Positive to contact K1 of 25Z6-G, and negative to shell contact of 6K7 r-f socket.)

STOCK No.	DESCRIPTION
	RECEIVER ASSEMBLIES
31198	Ballast—Ballast resistor-tube type BK55B (R7, R8)
31208	Capacitor—Antenna tuning capacitor bank (C20, C21, C22, C23, C24)

13601	Resistor—10 meg., ½ watt (R9)
31197	Shaft—Indicator pointer shaft and pulley
31199	Shield—Dial lamp shield
14171	Socket—Dial lamp socket
31251	Socket—Tube and ballast resistor socket
30631	Spring—Indicator drive cord tension spring
31207	Switch—Station selector switch (S20, S21, S22, S23, S24, S25, S26, S27, S28, S29, S30, S31)
31198	Tube—Ballast resistor tube type BK55B (R7, R8)
31966	Volume control and power switch (R1, S1)
	SPEAKER ASSEMBLIES (Speaker 84202-4)
31202	Cone—Speaker cone and voice coil (L5)
31201	Speaker—Complete
31203	Transformer—Output transformer (T1)
	MISCELLANEOUS ASSEMBLIES
31210	Button—Station selector push button
31205	Crystal—Station selector dial crystal
31095	Disc—10 celluloid protector discs for call letter markers
30863	Knob—Tuning or volume control knob
30991	Markers—Station selector button call letter markers
31079	Screw—Chassis mounting screws and washers
30900	Spring—Retaining spring for knob

RCA MFG. CO.

MODELS VA-22, VA-24
MODELS UY-122E,
UY-124

Specifications MODEL VA-22

Record Capacity..... Eight 10-inch or Seven 12-inch
MOTOR..... Constant-speed, self-starting
PICKUP..... Crystal
Pickup Impedance..... 0.1 meg., at 1,000 cycles
Average Output..... 1½ volts across 0.5 meg.

POWER SUPPLY RATINGS

A6..... 105-125 volts, 60 cycles, 25 watts
A5..... 105-125 volts, 50 cycles, 25 watts
B2..... 105-125 volts, 25 cycles, 25 watts

2nd Production:

The 2nd production of Model VA-22 uses mechanism similar to RP-139A and RP-145.* For replacement parts, refer to the Service Data on RP-139A and RP-145 as specified below:

Stock No.

PICKUP AND ARM ASSEMBLIES

Same as RP-145, except add:

33905 Crystal—Pickup crystal cartridge and needle screw for 25-cycle only....

OPERATING MECHANISM, MOTOR ASSEMBLIES, MOTORBOARD ASSEMBLIES

For 110-volt, 60-cycles, same as RP-145.
For 110-volt, 25-cycles, same as RP-139A.

MISCELLANEOUS ASSEMBLIES

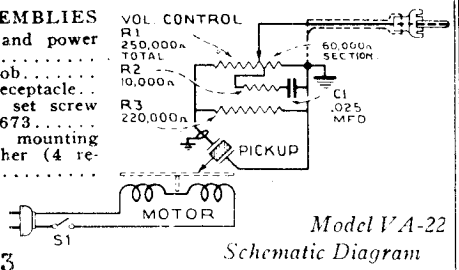
31108 Control—Volume control and power switch.....
12673 Knob—Volume control knob.....
31564 Receptacle—Needle card receptacle..
4119 Screw—No. 8-32 headless set screw for knob, Stock No. 12673.....
31470 Springs—Motorboard mounting springs, screw and washer (4 required).....

MODEL VA-24 IS A COMBINATION OF MODEL VA-22 AND OSC.22 WIRELESS OSCILLATOR, DATA FOR WHICH WILL BE FOUND ON RCA P.11-61 IN RIDER'S VOL.XI

Replacement Parts Model VA-22

STOCK No.	DESCRIPTION
	For Automatic Record Changer Parts, See Service Notes on RP 145*
	MISCELLANEOUS ASSEMBLIES
33595	Cable—Shielded output cable with male plug..
4870	Capacitor—.025 mfd. (C1).....
30698	Hinge—Cabinet lid hinge.....
31564	Holder—Needle card holder.....
12673	Knob—Volume control knob.....
14559	Resistor—10,000 ohms, ½ watt (R2).....
12264	Resistor—220,000 ohms, ½ watt (R3).....
4119	Screw—Headless set screw for knob, No. 12673
31470	Springs—Motorboard mounting springs, screw, and washers (4 req'd).....
33594	Support—Cabinet lid support.....
31108	Volume control (R1).....

*See Rider's "Automatic Record Changers" P.463



Model VA-22 Schematic Diagram

General Description

The circuit of Models UY-122E and UY-124 is the same as Model 97Y, except for the phonograph circuit which is shown at right. For other circuit details, refer to Service Data for Model 97Y, RCA P.9-109, RIDER'S VOL.IX

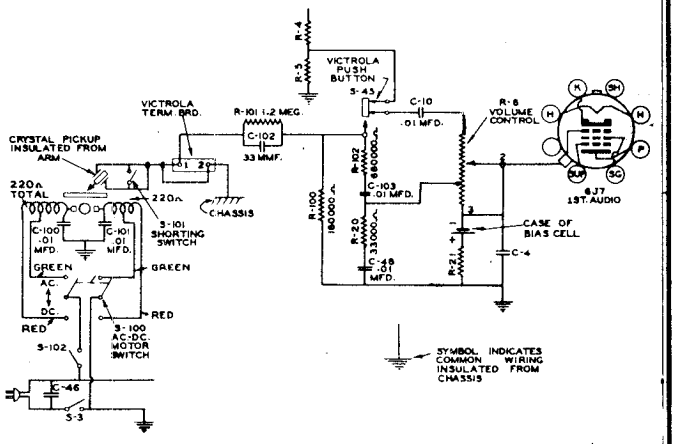
Alignment procedure, adjustments for electric tuning, voltages, and general service data, are the same as for Model 97Y.

Replacement parts for Models UY-122E and UY-124 are listed on the following page.

The phonograph motor has a switch to permit operation on 105-125 volts d.c., or 105-125 volts, 50-60 cycles a.c. The speed regulator screw should be adjusted for 78 r.p.m.

Lubrication should be maintained every six months, applying a few drops of light oil in each oil hole and at the spindle bearing.

The turntable switch should trip to the "off" position when the needle is 1¾ inches from the centerline of the turntable spindle.



Phonograph Circuit, Models UY-122E, UY-124.

STOCK No.	DESCRIPTION
	RECEIVER ASSEMBLIES
30284	Ballast—Ballast resistor tube (R22, R23).....
31767	Board—Antenna-ground terminal board.....
31579	Board—Phonograph terminal board.....
14338	Bushing—Variable condenser mounting bushing and screws.....
31400	Capacitor—Adjustable trimmer capacitor, two sections 2-10 mmfd. and one section 3-30 mmfd. (C21, C23, C25).....
14079	Capacitor—6.8 mmfd. (C1).....
31387	Capacitor—Antenna coil trimmer capacitor bank —20-470 mmfd. (C31, C32, C33, C34, C35, C36).....
12948	Capacitor—33 mmfd. (C3, C102).....
12725	Capacitor—150 mmfd. (C49).....
13003	Capacitor—180 mmfd. (C37).....
30433	Capacitor—470 mmfd. (C2).....
31381	Capacitor—620 mmfd. (C24).....
31435	Capacitor—750 mmfd. (C26).....
4881	Capacitor—3,300 mmfd. (C22).....
12897	Capacitor—4,700 mmfd. (C47).....
31405	Capacitor—6,000 mmfd. (C27).....
4838	Capacitor—.005 mfd. (C14, C43).....
14393	Capacitor—.01 mfd. (C10, C48, C103).....
11315	Capacitor—.015 mfd. (C12, C17).....
4886	Capacitor—.05 mfd. (C13, C20, C44).....
4839	Capacitor—0.1 mfd. (C38, C46).....
12484	Capacitor—0.25 mfd. (C4, C45).....
31576	Capacitor—Comprising one 32 mfd., one 20 mfd., and one 16 mfd. section (C15, C18, C19)...
31584	Capacitor—40 mfd. (C16).....
30904	Capacitor—100 mfd. (C5, C6, C7, C8).....
31581	Cell—Bias cell.....
31382	Clip—Mounting clip for coils and cores on oscillator bank.....
31402	Coil—Antenna coil (L1, L2, L3).....

MODELS UY-122, UY-124

RCA MFG. CO.

UY-122E, UY-124 Replacement Parts (Continued)

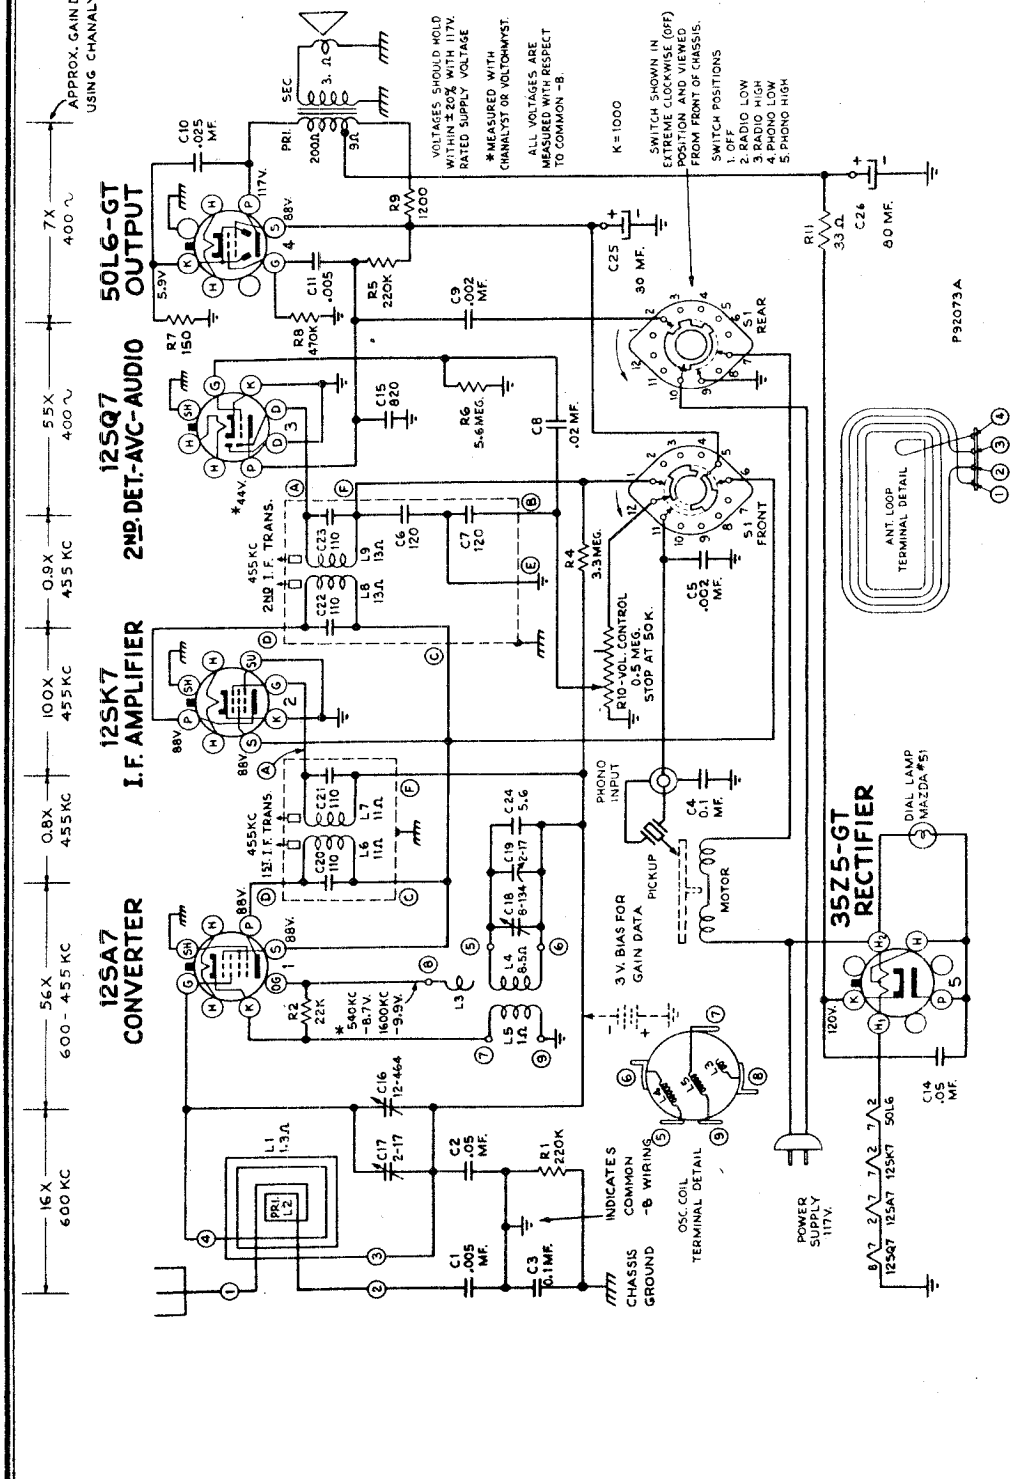
STOCK No.	DESCRIPTION
31401	Coil—Oscillator coil (L4, L5, L6, L7, L8, L9, C24)
31385	Coil—Push button oscillator coil (L37, L38)
31384	Coil—Push button oscillator coil (L39, L40)
31383	Coil—Push button oscillator coil (L41, L42)
31369	Condenser—2-gang variable tuning condenser (C28, C29, C30)
5119	Connector—3-contact female connector plug for speaker cable
31366	Control—Volume control, tone control, and on-off switch (R6, R13, S3)
31374	Cord—Drum drive cord
31375	Cord—Indicator pointer drive cord
30905	Core—Adjustable core for I.F. transformer
31386	Core—Adjustable core and stud assembly for oscillator bank
31372	Drum—Variable condenser drive cord drum and calibrator
31580	Holder—Bias cell holder
31480	Lamp—Dial lamp
30868	Plug—2-contact female for motor power cable
31373	Pulley—Drive cord pulley
5066	Reactor—(L16)
30284	Resistor—Ballast resistor (R22, R23)
30880	Resistor—150 ohms, ½ watt (R12)
30694	Resistor—3,900 ohms, ½ watt (R15)
14284	Resistor—22,000 ohms, 1/10 watt (R4)
12738	Resistor—27,000 ohms, ½ watt (R18)
12454	Resistor—33,000 ohms, ½ watt (R2, R20)
14560	Resistor—100,000 ohms, ½ watt (R9, R14)
13698	Resistor—180,000 ohms, ½ watt (R100)
12264	Resistor—220,000 ohms, ½ watt (R5)
12199	Resistor—270,000 ohms, ½ watt (R19)
14983	Resistor—330,000 ohms, ½ watt (R8)
12285	Resistor—470,000 ohms, ½ watt (R1, R21)
12413	Resistor—680,000 ohms, ½ watt (R102)
30208	Resistor—1.2 meg., ½ watt (R101)
12679	Resistor—2.2 meg., ½ watt (R3)
14343	Retainer—Drive cord pulley retainer
14887	Retainer—Retainer for drive cord pulley
4669	Screw—No. 8-32 square-head set screw for drum, Stock No. 31372
31368	Shaft—Station selector knob shaft and pulley
31199	Shield—Dial lamp shield
12110	Shield—Radiotron shield cap
31365	Socket—Dial lamp socket
31251	Socket—Tube socket
31313	Spring—Tension spring for station selector push button switch latch bar
31418	Spring—Indicator or drum drive cord tension spring
31370	Switch—Push button selector switch (S4, S5, S31, S32, S33, S34, S35, S36, S37, S38, S39, S40, S41, S42, S43, S44, S45)
31398	Switch—Range switch (S1, S2)
30902	Transformer—First i-f transformer (L10, L11, C5, C6)
30903	Transformer—Second i-f transformer (L12, L13, C7, C8)
30284	Tube—Ballast resistor tube (R22, R23)
	MOTOR ASSEMBLIES
32007	Escutcheon—Motor changeover switch escutcheon
32033	Field—Motor field coils and laminations
32034	Governor—Motor governor complete
32006	Motor—105-125 volts, 60 cycles A.C. and 105-125 volts, D.C., complete with switch (M1)
31616	Screw—Motor rotor bearing screw and nut
31620	Screw—Motor speed regulator screw and nut
32035	Shaft—Motor turntable spindle shaft and gear
31823	Switch — D.P.S.T. motor changeover switch (S100)
31622	Washer—Motor spindle shaft thrust bearing washers (1 metal, 1 felt)
	MOTOR BOARD ASSEMBLIES
9848	Cup—Used needle cup and lid complete
31464	Damper—One rubber spindle cap and one metal damper plate
31465	Mounting—Pickup arm base mounting — one rubber washer, one lockwasher, one nut
30870	Plug—2-contact male plug for motor and switch leads
31158	Screw—Motor mounting screws, washers, and spacers (sufficient for one motor)
31155	Spring—Used needle cup lid spring
30100	Spring—Automatic switch springs — one long spring and one short spring
31466	Switch—Automatic motor switch and switch lever
31467	Switch—Switch only — for automatic switch (S102)
31463	Turntable

STOCK No.	DESCRIPTION
	PICKUP AND ARM ASSEMBLIES
32134	Bushing—Pickup needle insertion guide—mounts on top of crystal cartridge
31156	Crystal—Pickup crystal cartridge, needle screw and shorting switch, less bushing, Stock No. 32134 (S101)
32016	Pickup and arm complete
31160	Screw—Needle screw
31469	Shaft—Pickup pivot arm and shaft assembly complete with base
	SPEAKER ASSEMBLIES Model UY124 (Speaker RL 71 A-1)
31275	Cone—Speaker cone and voice coil (L14)
5118	Plug—3-contact male plug for speaker
31798	Speaker—Less output transformer
14628	Transformer—Output transformer (T1)
	SPEAKER ASSEMBLIES Model UY122E (Speaker RL 73-5)
31310	Cone—Speaker cone and voice coil (L14)
5118	Plug—3-contact male plug for speaker
31997	Speaker complete
14628	Transformer—Output transformer (T1)
	MISCELLANEOUS ASSEMBLIES
31397	Button—Station selector push button
31456	Cover—8 protective covers for push button markers
31591	Dial—Station selector dial scale—Model UY124
31406	Dial—Station selector dial scale—Model UY122E
31395	Escutcheon—Tuning dial escutcheon only less push buttons and dial scale
30698	Hinge—Cabinet lid hinge—Model UY124
31103	Hinge—Cabinet lid hinge—Model UY122E
31392	Indicator—Indicator pointer, carriage, and clip
31355	Knob—Range switch knob
14359	Knob—Station selector knob
31391	Knob—Tone control knob
30773	Knob—Volume control knob
31458	Marker—"Dial Tuning" marker for push button—Model UY122E
31460	Marker—"Dial Tuning" marker for push button—Model UY124
31457	Marker—"Record Player" marker for push button—Model UY122E
31459	Marker—"Record Player" marker for push button—Model UY124
31589	Marker—Station call letter markers — Model UY122E
31590	Marker—Station call letter markers — Model UY124
31393	Screen—Dial color screen
11210	Screw—Chassis mounting screws, washers, and lockwashers—Model UY124
31471	Screw—Chassis mounting screws, washers, and lockwashers—Model UY122E
31470	Springs—Motorboard suspension top spring, bottom spring, screw, and lockwasher (4 required)
4982	Spring—Retaining spring for knob, Stock No. 14359
14270	Spring—Retaining spring for knob, Stock Nos. 30773 and 31355
30330	Spring—Retaining spring for knob, Stock No. 31391
30946	Support—Cabinet lid support—Model UY122E
11831	Support—Cabinet lid support—Model UY124

©John F. Rider

RCA MFG. CO.

MODELS 65U, 65AU
Chassis RC-1017A, 1017B



Frequency Range.....540-1,600 kc
Intermediate Frequency.....455 kc

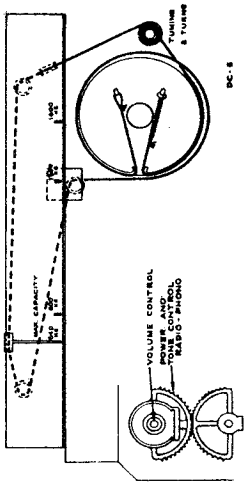
Power Output
Undistorted.....1.5 watts
Maximum.....2.4 watts

Loudspeaker (922279-1) "PM"
Size.....4 x 6 inch elliptical
V.C. Impedance.....3.4 ohms at 400 cycles

Power Supply Rating
105-125 volts, AC, 60 cycles.....60 watts

IMPORTANT—Do not plug chassis into a d-c power supply.

REFER TO SERVICE DATA FOR MODEL 960260-2 FOR INFORMATION AND PARTS ON RECORD CHANGER



Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise(plates fully meshed). Adjust indicator pointer to left (max. cap.) mark on dial back plate.

Record Changer:RCA Model 960260-2

MODELS 65U, 65AU,
Chassis RC-1017A,
RC-1017B

RCA MFG. CO.

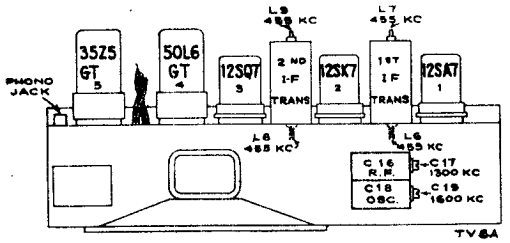
Alignment Procedure

CAUTION.—CLOSE TUNING CONDENSER PLATES COMPLETELY (C-C-W) BEFORE REMOVING CHASSIS FROM CABINET.

Take off both wooden strips on bottom of cabinet by removing woodscrews before loosening chassis bolts.

CRITICAL LEAD DRESS.—

1. All filament wires should be dressed close to chassis.
2. Dress lead from switch to phono jack close to chassis and away from power cord.
3. Dress capacitor between 12SQ7 grid and terminal board away from chassis and away from other parts.
4. Dress all exposed leads away from each other and away from chassis to prevent short circuits.
5. In instrument assembly the lead from the rear section of gang to loop shall be dressed away from chassis and other wires to loop.



Power Supply.—Although this model employs an ac-dc chassis, it is not suitable for use on d-c, as this would damage the motor.

Reversal of plug in outlet receptacle may reduce hum.

Test Oscillator.—Connect high side of test oscillator as shown in chart Connect low side through a .01 mf capacitor to common "—B". Keep the output signal as low as possible to avoid a-v-c action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control clockwise to radio maximum high position (3) for alignment.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I.F. grid, in series with .01 mfd.	455 kc	Quiet point 1,600 kc end of dial	L8 and L9 2nd I.F. transformer
2	1st Det. grid in series with .01 mfd.			L6 and L7 1st I.F. transformer *
	NOTE.—ANTENNA LOOP AND RECORD CHANGER MUST BE IN CABINET			
3	Antenna terminal in series with 220 mmfd.	1600 kc	Gang at minimum	C19 (osc.)
4	Radiated signal 1300 kc		Signal Frequency	C17 (ant.)
5	Repeat steps 3 and 4.			

*Do not readjust L8 or L9 when test oscillator is connected to 1st Det.

Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1017A RC 1017B
70389	Bearing—Tuning knob shaft bearing
70407	Button—Plug button (2 required)
70997	Capacitor—Mica, 5.6 mmf. (C24)
39650	Capacitor—Mica, 820 mmf. (C15)
70601	Capacitor—Tubular, .002 mfd., 400 volts (C5, C9)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C1, C11)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C8)
70612	Capacitor—Tubular, .025 mfd., 400 volts (C10)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C2, C14)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C3, C4)
*72312	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 150 volts and 1 section of 80 mfd., 150 volts (C25, C26)
70403	Coil—Oscillator coil
70383	Condenser—Variable tuning condenser complete with drum
70322	Control—Volume control
32634	Cord—Drive cord (approx. 48" overall length)
70392	Cord—Power cord
70384	Drum—Drive drum
70397	Gear—Power or radio-phono switch gear
70395	Gear—Volume control gear and spring assembly
70404	Indicator—Station selector indicator
70391	Insulator—Bakelite insulator for phono input socket
11765	Lamp—Dial lamp
*72311	Loop—Antenna loop
70382	Plate—Dial back plate complete with pulleys less dial
30868	Plug—2 contact female plug for "AC" cable
36230	Pulley—Drive cord pulley
*72313	Resistor—33 ohms, 1 watt (R11)
30880	Resistor—150 ohms, ¼ watt (R7)
6134	Resistor—1200 ohms, 1 watt (R9)
30492	Resistor—22,000 ohms, ¼ watt (R2)
14583	Resistor—220,000 ohms, ¼ watt (R1, R5)
30648	Resistor—470,000 ohms, ¼ watt (R8)
12928	Resistor—3.3 megohms, ¼ watt (R4)
31455	Resistor—5.6 megohms, ¼ watt (R6)
14974	Screw—#8-32 x 3/16" long set screw for lower gear
70388	Shaft—Tuning knob shaft
34449	Socket—Lamp socket
35787	Socket—Phono input socket
37605	Socket—Tube socket—moulded
70390	Spring—Drive cord tension spring
70396	Spring—Volume control gear tension spring
70394	Switch—Power or radio phono switch
70386	Transformer—First I.F. transformer
70387	Transformer—Second I.F. transformer
70385	Transformer—Output transformer
33726	Washer—"C" washer for tuning knob shaft
70406	Washer—Spring washer for volume control
	SPEAKER ASSEMBLY 922279-1
70405	Speaker—4" x 6" P.M. speaker complete
	SPEAKER ASSEMBLY 922258-2
71058	Speaker—4" x 6" P.M. speaker complete
	SPEAKER ASSEMBLY 922258-1
70470	Speaker—4" x 6" P.M. elliptical speaker complete
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
70398	Clamp—Dial clamps (1 set)
71984	Decal—Trade mark decal (RCA Victor)
71966	Decal—Trade mark decal (Victrola)
70402	Dial—Glass dial
71595	Feet—Rubber feet (4 required)
X1630	Grille—Baffle board and grille cloth
70707	Hinge—Lid hinge (2 required)
70401	Knob—Power switch and radio-phono switch knob
70400	Knob—Tuning knob
70399	Knob—Volume control knob
71815	Mounting—One set of hardware consisting of four springs, two spring washers and two rubber washers to mount record changer.
14270	Spring—Retaining spring for knobs
71824	Stud—Stud and screw to mount lid hinge (1 set)
39545	Support—Lid support
X1386	Cabinet—Cabinet for Model 65U

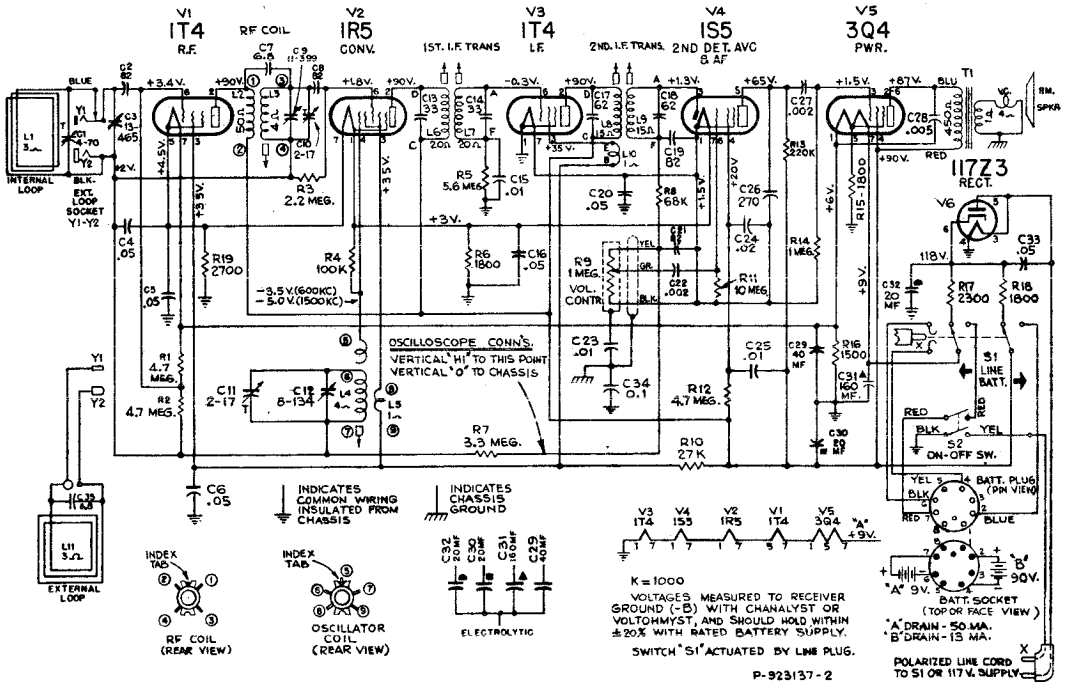
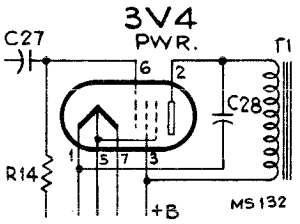
RCA MFG. CO.

MODEL 66BX
Chassis RC-1040,
RC-1040A

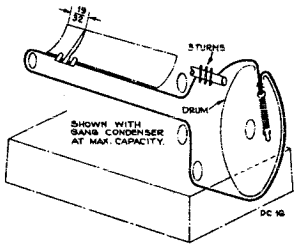


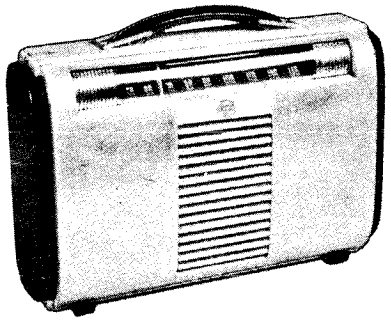
CAUTION.—

1. **Do not remove any tubes from the chassis with the set operating and the plug connected to the power line. Damage to tubes may result.**
2. **When cleaning the aluminum portion of the case use soap and water or cleaning fluid. Do not use abrasive cleansers.**



RC-1040A





NOTE—The Chassis marked RC-1040A have R-3 and C-8 omitted and have the power tube socket connected for a 3V4 tube.

Frequency Range ..... 540-1,600 kc

Intermediate Frequency ..... 455 kc

110 to 125 volts, AC 50 or 60 cycles, or DC ..... 14 watts

Batteries required ..... One RCA Battery Pack VS019 or equivalent

Tube Complement

(1) RCA—1T4 ..... R.F.
(2) RCA—1R5 ..... Converter
(3) RCA—1T4 ..... I.F.-Amplifier
(4) RCA—1S5 ..... 2nd Det. AVC. & A.F.-Amplifier
(5) RCA—3Q4—RC-1040 ..... Power Output
RCA—3V4—RC-1040A ..... Power Output
(6) RCA—117Z3 ..... Rectifier

Using External Loop.—

A loop antenna is housed inside the cabinet. Under normal conditions this will give satisfactory reception. If however the receiver is used in a location remote from broadcasting stations where signals are weak, or where interference is excessive, or in a shielded compartment such as an automobile, airplane or railroad train, an RCA external loop can be used.

This loop antenna has a strap connector cord with indentical two prong plugs on either end, this makes it convenient in connecting it to the circuit through the receptacle located in the left hand side of the chassis.

Open the case, plug the antenna cord into the socket (it will only go in one way), bring the strap out through the slot in the case and attach the Loop Antenna by means of the suction cup to any convenient vertical surface.

This loop antenna can be stored in the cabinet, in the compartment below the battery pack, and the cord in the small compartment in the lower right hand corner of the cabinet.

Current Consumption

Battery Operation ..... "A" 50 milliamperes, "B" 13 milliamperes
Total Rect. Current (117 volt, 60 cycle) ..... 61 mils.

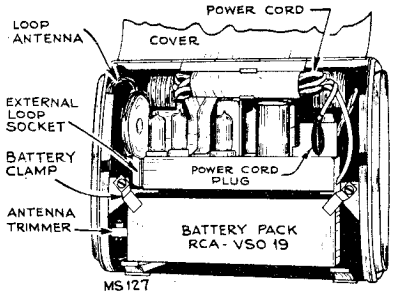
Power Output

Maximum ..... .23 watt

Loudspeaker ..... 4 x 6 in. elliptical P.M. 3.4 ohms at 400 cycles

CRITICAL LEAD DRESS

1. Dress all filament leads next to chassis.
2. Keep the leads short on the ends of the three components which connect to the grid terminal (#6) of the r.f. socket. (R-1, R-2, C-2).
3. Separate leads to front and center sections of gang as far as possible and away from tubes.
4. Dress loop leads away from tuning drum and battery.
5. Dress output transformer leads away from rear section of gang.
6. Dress r.f. plate lead away from r.f. grid circuit.
7. Dress components and wiring near external loop socket to clear external loop pins.
8. Dress avc lead away from 2nd IF transformer and associated components.
9. Dress converter plate lead away from chassis and away from output twisted leads.
10. Dress twisted output leads up and away from other wiring.
11. Dress volume control cable, switch cable, and line receptacle leads away from rectifier tube and resistor case.
12. Dress 1st audio plate lead up and away from other wiring.
13. Do not restrict floating action of sockets by tight wiring.



—1946

MODEL 66BX
Chassis RC-1040,
RC-1040A

RCA MFG. CO.

Alignment Procedure

Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

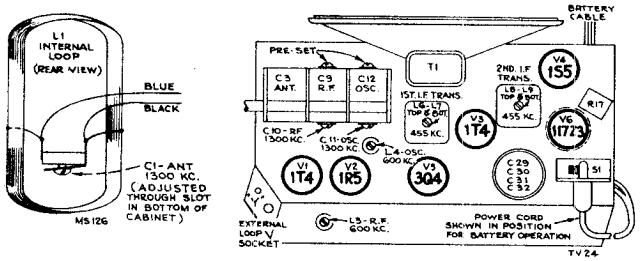
Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis and keep the oscillator output as low as possible to avoid AVC action.

Calibration Scale.—The calibrated dial scale is permanently connected to chassis. It can therefore be used directly as a reference for alignment.

With the gang at full mesh set the dial pointer so that the left hand edge of the pointer is 19/64 inches to the right of the point indicated in the dial cord drawing.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	High side of loop (Blue lead) in series with 0.1 mfd.	455 kc	Gang at max. cap.	L8, L9 (2nd I.F. Trans.)* L6, L7 (1st I.F. Trans.)
2	High side of loop (Blue lead) in series with 0.1 mfd. (Bottom shield cover in place and chassis out of cabinet)	1300 kc	1300 kc	C11—(osc.) C10—(R.F.)
3		600 kc	600 kc	L4 (osc.) L3 (R.F.)
** 4	220 mmf. in series with a single turn loop 4x8 in., approx. 3 in. from receiver loop. (Chassis in cabinet C-1 connected and rear lid of cabinet closed)	1300 kc	1300 kc	C1 (loop)



*If two peaks are found with top slugs use the one with stud in the outer position.
**Adjust C-1 loop cap with back cover of case closed. Access to trimmer is made through small slot in case provided for cable of external loop.

AC-DC Operation.—

This receiver will operate on 105 to 125 volts, AC 50 or 60 cycles, or DC.

A power cord is stored in the fiber tube which is clamped above the chassis inside the cabinet. To open the cabinet, slide the two plastic feet in the rear of the cabinet toward each other, and raise the back cover upward on its hinges. Then pull the power cord plug out of the socket on the top of the chassis as shown, and take out and unroll the power cord. A slot in the bottom of the cabinet allows the closing of the cabinet with the power cord passing through. Close the cabinet with the cord extending through the slot and insert the plug into a convenient electrical outlet.

When returning to battery operation, be sure to replace the power plug in its socket inside the case with the cord stored in the fiber tube.

NOTE.—If reception is not obtained on DC, reverse plug in outlet receptacle. This may also reduce hum on AC operation.

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1040
*71056	Bracket—Drive cord pulley bracket complete with one (1) pulley
*71054	Bracket—Drive cord pulley bracket complete with two (2) pulleys
*71044	Bracket—Power switch bracket complete with actuating lever less power switch
*71042	Button—Plug button
31709	Capacitor—Ceramic, 6.8 mmf. (C7)
*71514	Capacitor—Ceramic, 82 mmf. (C2, C8, C19, C21)
*71540	Capacitor—Ceramic, 270 mmf. (C26)
*71552	Capacitor—Tubular, .002 mfd., 400 volts (C22, C27)
*71553	Capacitor—Tubular, .005 mfd., 400 volts (C28)
70610	Capacitor—Tubular, .01 mfd., 400 volts (C15, C23, C25)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C24)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C4, C6, C33)
71551	Capacitor—Tubular, .05 mfd., 200 volts (C5, C16, C20)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C34)
*71043	Capacitor—Electrolytic comprising 2 sections of 20 mfd., 150 volts, 1 section of 160 mfd., 25 volts and 1 section of 40 mfd., 25 volts (C29, C30, C31, C32)
*71053	Clip—Spring clip for knob
*71401	Coil—Oscillator coil (L4, L5)
*71402	Coil—R.F. Coil (L2, L3)
*71035	Condenser—Variable tuning condenser (C3, C9, C10, C11, C12)
*71057	Control—Volume control (R9)
32634	Cord—Drive cord (approx. 37" overall length)
70392	Cord—Power cord
*71048	Dial—Dial scale and window assembly
*71036	Drum—Drive drum
*71031	Holder—Power cord holder
*71030	Indicator—Station selector indicator
*71032	Insulator—Rectangular bakelite insulator—between chassis base and dial support bracket (2 required)
*71052	Knob—Tuning knob and volume control knob
18469	Plate—Electrolytic capacitor mounting plate
*71041	Plug—4 prong male plug for battery cable
36230	Pulley—Drive cord pulley
30654	Resistor—1500 ohms, ¼ watt (R16)
12194	Resistor—1800 ohms, ¼ watt (R6, R15)
38875	Resistor—1800 ohms, 1 watt (R18)
*71038	Resistor—Ballast resistor, 2300 ohms, 6 watt (R17)
30730	Resistor—2700 ohms, ¼ watt (R19)
30409	Resistor—27,000 ohms, ¼ watt (R10)
14138	Resistor—68,000 ohms, ¼ watt (R8)
3252	Resistor—100,000 ohms, ¼ watt (R4)
14583	Resistor—220,000 ohms, ¼ watt (R13)
30652	Resistor—1 megohm, ¼ watt (R14)
30649	Resistor—2.2 megohms, ¼ watt (R3)
31417	Resistor—3.3 megohms, ¼ watt (R7)
30931	Resistor—4.7 megohms, ¼ watt (R1, R2, R12)
31455	Resistor—5.6 megohms, ¼ watt (R5)
30992	Resistor—10 megohms, ¼ watt (R11)
*71055	Shaft—Tuning knob shaft
*71050	Shield—L.H. end shield for dial
*71051	Shield—R.H. end shield for dial

STOCK No.	DESCRIPTION
*71040	Socket—2 contact female socket for external loop
*71037	Socket—Tube socket—miniature—7 prong—floating
*71827	Socket—Tube socket—miniature—7 prong—bottom mounted
70390	Spring—Drive cord spring
*71053	Spring—Retaining spring for knob
*71039	Switch—Line—battery change switch (S1)
*71045	Switch—Power switch (S2)
*71299	Transformer—First I.F. transformer (L6, L7, C13, C14)
*71400	Transformer—Second I.F. transformer (L8, L9, L10, C17, C18)
*71047	Transformer—Output transformer (T1)
*71081	Washer—"C" washer for tuning knob shaft
*71033	Washer—Insulating washer, extruded, for mounting dial support to chassis base (4 req'd.) and to mount base holder bracket
*71034	Washer—Insulating washer—flat, to mount base holder bracket
*71049	Window—Dial window
	SPEAKER ASSEMBLY 922258-2
*71059	Gasket—Speaker gasket (black tubing)
71058	Speaker—4" x 6" P.M. speaker complete with cone and voice coil
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
*71074	Arm—Shutter arm lever
*71617	Cable—Connecting cable for external loop
*71069	Capacitor—Adjustable trimmer, 3-35 mmf. (C1)
*71080	Clip—Case side spring clip and screw (2 req'd.)
*71619	Cup—Suction cup for mounting external loop
*71060	Back—Case back complete with center strip
*71061	Foot—Case foot (moulded) (2 req'd.)
*71068	Foot—Case foot (wood) (2 req'd.)
*71067	Front—Case front complete less shutter
*71618	Gasket—Gasket seal to hold loop together
*71063	Handle—Carrying handle
*71062	Latch—Case latch (2 req'd.)
*71065	Link—Carrying handle link (2 req'd.)
*71616	Loop—External antenna loop (L11, C35)
*71079	Loop—Antenna loop—internal (L1)
*71064	Retainer—Battery retainer spring bracket (2 required)
*71066	Screw—#8-32 x 5/16" long screw to fasten case together (2 required) for battery holders (2 required)
*71077	Screw—Screw complete with washer and nut to secure one side to case front or case latch
*71071	Shutter—Case shutter
*71076	Side—Case side—L.H.
*71075	Side—Case side—R.H. (loop side)—less capacitor assembly
*71072	Spring—Case shutter compression spring
31608	Washer—"C" washer for case shutter's shafts
*71078	Washer—Dampening washer for shutter shafts

Power Output

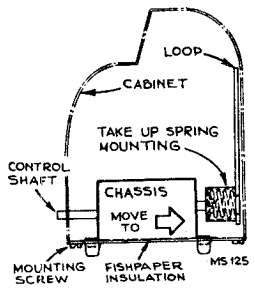
Undistorted ..... 1.0 watts
Maximum ..... 1.5 watts

Loudspeaker (922258-2)

Size ..... 4 x 6" elliptical P.M.
V.C. Impedance ..... 3.4 ohms at 400 cycles

Power Supply Rating

105-125 volts, AC, 50 or 60 cycles, or DC ..... 27.6 watts



The construction of the cabinets for Models 66X1 and 2 makes it necessary to remove the chassis for replacing tubes. To do this, proceed as follows:

1. Remove the power plug from the service receptacle.
2. Remove control knobs.
3. Remove the six slotted screws around the edge of the metal base plate. (**Do not remove the four feet from the base plate as this will separate the base plate from the chassis.**)
4. Tilt the cabinet forward so that the bottom rear edge of the cabinet raises above base plate.
5. Hold the chassis with one hand while pushing the cabinet forward and upward to clear the control shafts.

Lead Dress

1. Dress all filament and power leads down to chassis and as far as possible from all audio grid and plate wiring.
2. Dress power cord back and away from C-14 (1st audio coupling condenser).
3. Dress C-14 toward 12SQ7 socket and away from the switch.
4. Dress C-16 (output by-pass condenser) down to chassis.
5. Dress blue lead from phono jack to volume control in air and away from output transformer.
7. Dress all leads and parts away from oscillator coils.
8. Dress C-2 (R.F. coupling condenser) back to chassis.
9. Avoid excessive lead lengths in C-27 (short wave fixed . imer) and short wave antenna coil.
10. Dress pilot light leads (above chassis) toward dial support and away from the 35Z5 tube.

Alignment Procedure

Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a 0.1 mf. capacitor to common "—B." Keep the output signal as low as possible to avoid A.V.C. action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum clockwise position, station selector switch to broadcast maximum high position (pos. 2), for broadcast alignment and to position 3 for high frequency band.

Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates fully meshed). Adjust indicator to $2^{15}/_{16}$ in. from end of backplate as indicated in drawing.

On models 66X1 and 2 the dial indicator is accessible for adjustment by removing the metal strip below the dial glass. (Lift and swing the top forward).

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial back plate.

Power Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Steps	Connect high side of the rest oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	Pin #4 (signal grid) 12SK7 IF tube in series with 0.1 mfd.	455 kc	Quiet point at 1600 kc end of the dial	T2† 2nd I-F trans.
2	Pin #8 (signal grid) 12SA7 1st det. in series with 0.1 mfd.			T1 1st I-F trans.
3	Antenna in series with 200 mmf.			L2 for minimum output (Wave trap)
4		1300 kc	1300 kc	C22 (osc.) C24 (ant.)
5		600 kc	600 kc	L13 While rocking gang
6	Repeat steps 4 and 5.			
7	Antenna in series with 50 mmf.	9.5 mc.	9.5 mc.	C20 (Osc.)*
8		9.5 mc.	9.5 mc.	C26 Ant. while rocking gang
9		11.8 mc.	11.8 mc.	L10 (Osc.)**
10				L14 while rocking gang
11	Repeat steps 9 and 10.			

*If two peaks are obtained use minimum cap peak.
**If two peaks are obtained use minimum inductance peak.
†Do not repeat step No. 1.

MODEL 9D

RADIO MFG. ENG. INC.

OPERATION OF THE CRYSTAL FILTER

To operate the crystal filter for single signal reception, the white dot on the knob "D" should be set to the position corresponding to "S" and the knob "C" adjusted slightly to a position where background response is a minimum. When tuning for CW signals using the crystal filter the tuning should be done with dial number 2, and rotation should be slow due to the sharp resonance characteristic of the filter. In case comparative elimination of noises does not occur when the selectivity control "C" is adjusted from side to side, it is possible that the balancing condenser has become misaligned. In order to adjust this alignment to the null point, use an insulated trimmer screw driver and adjust the pressure screw on the small mica trimmer condenser located just behind and below the crystal filter compartment. This is accessible by raising the receiver cabinet cover and removing the shield box cover of the crystal filter compartment. With the receiver merely on the air or turned to station reception, this balance can be made by slightly turning the screw either way until minimum receiver response is obtained.

When phone stations are to be received the carrier may be tuned in and the selectivity control "C" adjusted to broaden the crystal response. Although the result will be mostly a low frequency audio output, sufficient articulation frequencies are passed to make phone reception intelligible. Of course, when the crystal is used for phone reception the apparent strength of the speaker output is reduced due to the fact that the crystal has eliminated most of the side bands of the modulated carrier and since these eliminated higher side band frequencies contain some of the sound energy going to the speaker, the net effect is a reduction in sound output. However, with CW reception, when the carrier to be received, is exactly tuned there is no reduction in the signal beat when the crystal is being used.

When the crystal is placed parallel in the filter circuit (knob "D" set to position B, diagram 40A) it tends to short circuit (series resonance) at its resonant frequency. This function is valuable for eliminating interfering heterodynes and its effect may be sharpened and broadened slightly in exactly the same way as the series operation of the filter. Its use in this manner is many times of invaluable service in connection with radio telephone reception.

THE MONITOR FOR MODULATION

On the rear of the chassis (Figure C) is a terminal marked "monitor feed wire terminal", which is used to connect a pick-up wire to the monitor curcuit. By pulling out the knob "B" the monitor circuit is connected and the radio amplifier circuits disconnected. The monitor is intended for the checking of modulation quality of a transmitter in the proximity of the receiver. For this purpose 10 feet or so, of wire lying on the floor, may be connected to the monitor terminal post. If more or less is needed that fact can be determined by noting the magnitude of the audio output. When using the monitor it is recommended that listening be done with headphones to prevent audio feed-back, especially when the transmitter modulation originates at a nearby microphone. If transcription equipment is used the receiver loud speaker may be used. Volume may be controlled by the rotation of knob "B" in the same manner asthe radio volume of the receiver is controlled.

The monitor switch is operated by pulling on the knob "B" and thus also becomes the SNED-RECEIVE switch, since it opens the plate supply to the radio and IF amplifiers. The monitoring of CW signals can be accomplished by leaving the knob "B" pushed in toward the panel in the regular radio receiving position and the manual volume control and beat oscillator knob "F" turned considerably toward the maximum clockwise position. The frequency of the transmitter must then be tuned to by the regular tuning controls and the beat note will be heard in the same manner as that of any received signal. It may be necessary in this connection to remove the regular antenna and substitute a shorter length in case the received signal is too strong. However, the manual volume control knob "F", when in the maximum clockwise position, reduces the receiver's sensitivity to a point which will accomodate most amateur transmitters.

SERVICE NOTES FOR THE RME-45 RECEIVER

If the owner has available an accurate signal generator he may, by following the steps outlined in succeeding paragraphs, realign and recalibrate the receiver. If a signal generator is not available he may take the receiver to a reputable service man to have the work done. In addition to the signal generator an insulated screw driver will be required.

NOTE: The "R" meter makes an excellent resonance indicating device. All adjustments are made with the AVC on.

I. F. ALIGNMENT

The I.F. frequency of the RME-45 is 455 KC. The bandswitch should be turned to Band I. The tuning dial should be turned to the low frequency end (.55Mc). The hot lead from the signal generator is clipped to the lug on the detector section (middle) of the tuning condenser. With the signal generator set to 455 KC., each padder on the 1st, 2nd and 3rd I.F. transformers (see Fig. 1) are carefully adjusted for maximum response as indicated on the meter.

NOTE: The frequency of the signal generator must be set accurately to that of the crystal. This is done in the following manner:

Turn the crystal selectivity switch to Position 5. Carefully adjust the signal generator frequency until the carrier meter rises sharply. The signal generator is now accurately on the crystal frequency. The crystal selectivity switch is turned to "OFF" and the three I.F. transformers are aligned as before.

BEAT OSCILLATOR ADJUSTMENT

With the signal generator connected as for aligning I.F. circuits, turn "B.O. SWITCH" on and set "B.O. PITCH" control pointer vertical. With an insulated screw driver adjust B.O. padder (See Fig. 1) until zero beat is obtained.

ALIGNMENT OF THE RADIO FREQUENCY SECTION

Alignment of the radio frequency section of the receiver will affect, principally, the calibration of the receiver. Within certain limits this, of course, will also affect the sensitivity. Small variations in frequency (up to 2%) will not materially reduce the sensitivity of the receiver, although they will, of course, show up as variations in the calibration as indicated by the setting of the MAIN TUNING DIAL. Correction of any variation of calibration can be made by following the suggestions outlined in the following paragraphs.

Band I includes frequencies between 540 and 1600 KC. For Band I there are two frequency adjustments for adjusting the dial to the proper calibration. The adjustments are made on the top of the chassis through the dust cover over the Band I and II coils. The proper holes for making the adjustments are indicated on the top sketch on Fig. 3. There are 6 sets of large and small holes each. The two sets toward the rear of the chassis are the oscillator adjustments. The set toward the front are the RF stage adjustments; and the center set are for the detector. Under the large hole is a padder for adjusting the high frequency coil and adjusts the low frequency end.

The next step is to choose a station or a signal of accurately known frequency on the low frequency end of the range (for example 600KC.) and set the main tuning scale to read this frequency. If the station is not tuned in which the scale indicates its frequency it may be brought in by adjusting the oscillator coil core. This may be done with a small screw driver through the small hole marked "BAND I OSC" on Fig. 3. Another station or signal is now selected near the high frequency end of the range (for example 1400 KC). If this signal is not heard when the dial is accurately set to its frequency it may be brought in by adjusting the padder under the large hole marked "BAND I OSC" by means of an insulated trimmer tool. When this signal is accurately brought in as indicated by a maximum reading on the carrier meter one should go back to the low frequency test point and readjust it if it has changed. It may be necessary to go back and forth several times until both frequencies are accurately calibrated.

The procedure in calibrating and aligning Band II is the same for Band I. On this band two frequencies, such as 1800 and 2800 KC may be used.

The four high frequency bands are calibrated and aligned by removing the bottom plate from the receiver. The screws holding the four rubber feet and the four small screws between them are removed. This allows the bottom plate to be removed. It will be found that an aluminum plate covers the coils. This plate has holes over the 12 padders and all adjustments should be made with this plate in position.

Since the inductance of the coils are accurately adjusted and set at the factory it is necessary only to calibrate one frequency on each band. The same applies to the alignment of the RF and detector padders. Suggested calibration points for each band are as follows:

Band III	5 MC.
Band IV	9 MC.
Band V	16 MC.
Band VI	30 MC.

From the bottom sketch on Fig. 3 the location of each of the 3 padders for each band may be readily located. Note in particular the location of Band V and VI padders. Adjustments should be made with insulated screw driver type of trimmer tool.

High frequency beat is used on all bands. That is to say, that the oscillator is 455 KC higher in frequency than the signal received.

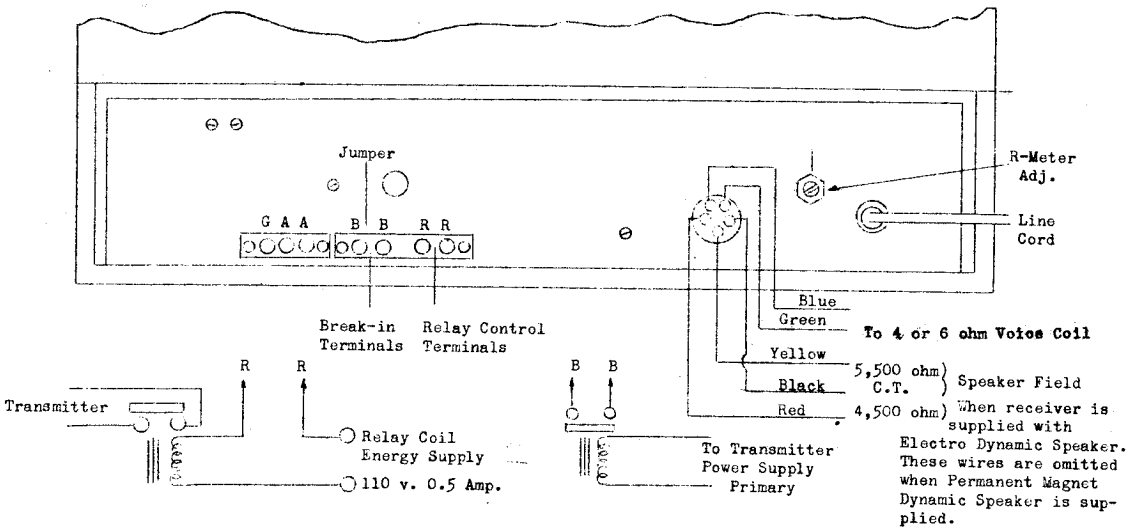
If sufficient input is used each signal can be received at two points, differing by 910 kilocycles. The other signal is the image or "low beat" signal. The higher frequency signal received, according to the receiver dial, is the proper one and the circuits should be aligned to it.

When using a signal generator or test oscillator to align the set a resistor of about 300 ohms should be inserted between the signal generator and the antenna connection. This will prevent misaligning of the RF stage caused by the connection of the low impedance of the signal generators output circuit across the receiver input.

In order that the full capabilities of the crystal filter in the Model 45 be realized the following procedure in tuning it is recommended:

On the top of the crystal filter box is a trimmer (Fig. 1). The easiest way to adjust this trimmer is to tune in a station in the broadcast band that is broadcasting music, preferably an orchestra. The XTAL SELECTIVITY switch should be turned to Position 5 and the signal tuned in accurately on the crystal. The XTAL PHASING control should be adjusted to give minimum background noise. The SELECTIVITY control is then turned to Position 1. The trimmer should then be carefully adjusted. As the trimmer is turned it will be found that the character of the music changes. The trimmer should be set to a point that sounds the most natural. If the adjustment is made carefully there will be a regular sharpening of the receiver as the SELECTIVITY switch is turned from "OFF" to Position 5.

RADIO MFG. ENG. INC.



Relay to Control transmitter typical circuit diagram for connecting of relay control. Connect to terminal pair marked "R" on receiver. Relay closes when Stand-by Switch is turned to "Trans".

Typical circuit for remote break-in control of receiver. Terminal pair marked "B" on receiver connect to "B - B". Circuit between "B" pair is closed when relay or remote switch is closed during transmitter stand-by periods. Break-in terminals must be shorted if above circuit is not used.

RADIO MFG. ENG. INC.

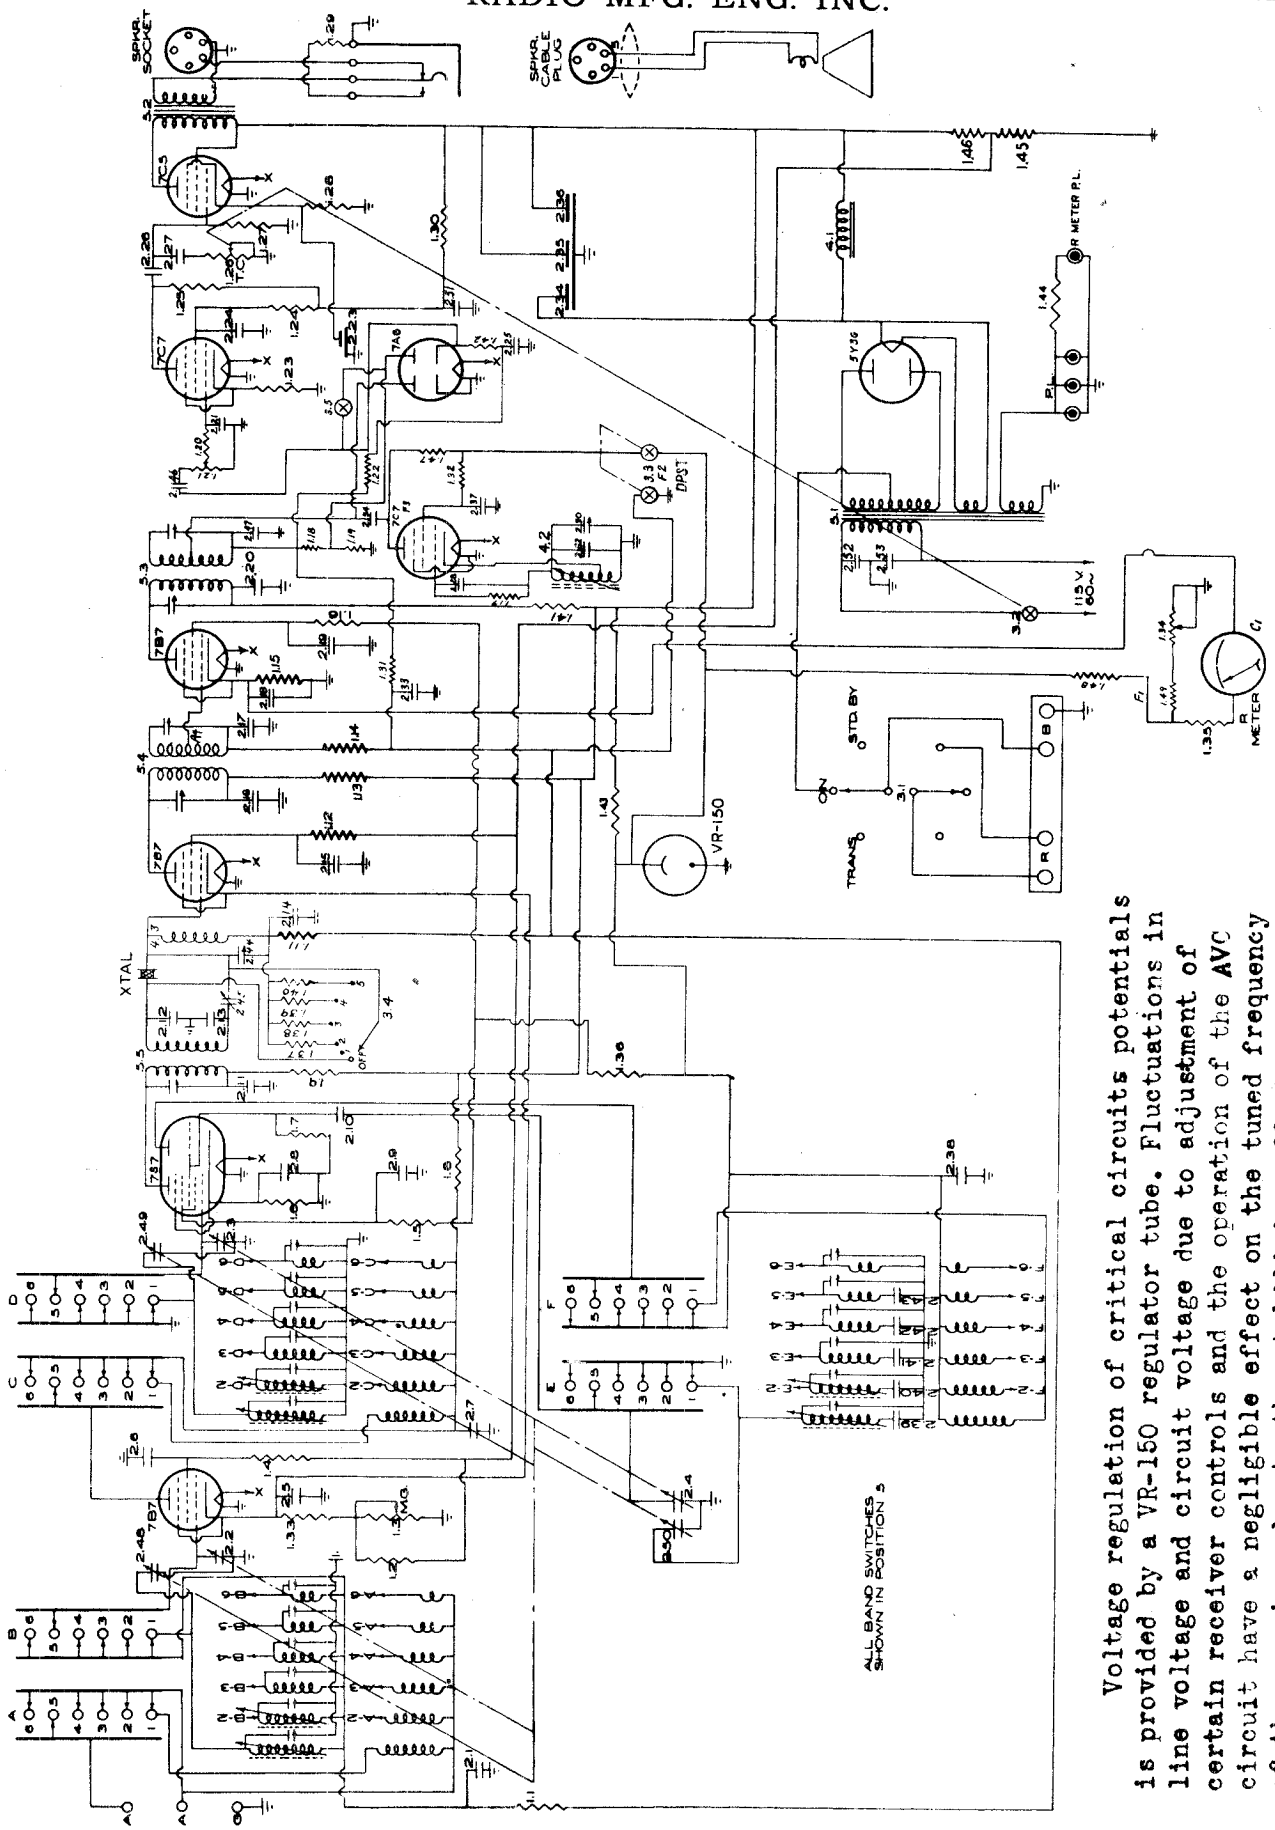
MODEL 45B



Voltage regulation of critical circuits potentials is provided by a VR-150 regulator tube. Fluctuations in line voltage and circuit voltage due to adjustment of certain receiver controls and the operation of the AVC circuit have a negligible effect on the tuned frequency of the receiver due to the stabilizing effects provided by this regulator.

©John F. Rider

For Clarified schematics, see Pp.15-7 to 15-9; for Alignment, see P.15-12; for Voltage and Parts list, see P.15-19

OPERATION

Each control on the RME-45 receiver has a definite function and the operator should familiarize himself with their purpose and operation in order to obtain the best results.

The Cal-O-Matic two speed tuning system is one of the important features of the RME-45.

The tuning mechanism uses a preloaded gear train which is entirely free from backlash. The smaller tuning knob rotates approximately five times while the larger one is turning once. This two speed tuning control enables the operator to cover a frequency band at the correct rate with the larger knob and to tune in a weak signal or one partially covered by other signals with the smaller one.

Elimination of the bandspread condenser lowers the losses in the RF circuit and therefor gives great gain and greater stability.

Five Amateur bands are directly calibrated on the bandspread dial, but the Cal-O-Matic tuning system also includes an easy and accurate method of logging any frequency between 550 kc and 33,000 kc.

The inner half circle on the megacycle scale is divided into five sections, 0 through 4, and the inner circumference of the bandspread dial is marked off in 100 equal divisions. While the red pointer is covering one of the megacycle scale sections the bandspread dial makes one complete revolution. After a station has been heard it can be logged accurately by using the two sets of figures.

For example, if a station is heard on band 5 with the pointer in section 3 of the megacycle scale and with the bandspread dial at 28, that station is definitely logged at 328 because it will always be found at 328 on band 5. Or, if a station is logged at 173 on band 3, it is always tuned in on band 3 by turning the knob until the red pointer is in section 1 of the megacycle scale and until 73 comes up on the bandspread dial.

This method of logging enables the operator to return to a station very quickly and since there is no other dial to pre-set the station is always found at the same place.

In order to receive a frequency in one of the Amateur bands it is necessary only to set the band-change switch on the proper band and to tune the receiver until the red pointer is opposite the approximate frequency on the megacycle scale. The Amateur frequency may then be read directly from the calibrated bandspread dial.

The BAND SELECTOR SWITCH selects the frequency range desired. The range of the receiver is divided into 6 bands. The range covered by each band is as follows:

Band I	.540	to	1.6 MC	American Broadcast
Band II	1.6	to	2.9 MC	
Band III	2.9	to	5.4 MC	
Band IV	5.4	to	9.8 MC	
Band V	9.8	to	18.0 MC	
Band VI	18.0	to	33.0 MC	

Actually these figures do not represent the full range of each band since there is considerable overlap between the end of one band and the start of the next.

The LINE TONE control turns the receiver on and off. As the control is turned clockwise the line switch will close. Continued turning of the knob controls the audio response.

The STAND-BY SWITCH on the extreme right end of the control panel is used to make the receiver inoperative without turning off the line switch. When the control is in the center at "on" the receiver will operate, when it is turned to the right to "Standby" it will be dead. The third position labeled "Trans" also makes the receiver inoperative and, in addition, closes the relay circuit as mentioned previously.

The AUDIO GAIN Control to the left of the stand-by switch is used to adjust the audio volume to the desired level.

Below the control panel is a toggle switch labeled B.O. SWITCH turning on the beat oscillator. The beat oscillator is indispensible in the reception of CW signals and is an aid in locating weak phone carriers.

The pitch of the beat frequency may be varied by means of the control labeled B.O. Pitch.

The beat oscillator may be used either with or without the automatic volume control (AVC). It is usually more satisfactory to receive CW signals with the AVC less effective. This may be accomplished by turning the control labeled R.F. GAIN slightly counter clockwise. Continued counter clockwise rotation of this control reduces the gain of the receiver manually. Automatic control of the receiver gain is fully effective only when the R.F. GAIN control knob is rotated to and set at its maximum clockwise position (position approximately marked AVC). The position of this control is also intimately related to the proper operation of the CARRIER LEVEL or "R" meter. (See paragraph on CARRIER LEVEL meter).

Below the control panel on the left is a jack marked "PHONES". Any pair of good headphones may be plugged into this jack for headphone reception. When the phones are plugged in the speaker is automatically cut out.

The CARRIER LEVEL meter is supplied with the Model 45. This meter indicates the average value of the carrier being received. The meter is calibrated in db as well as in conventional numbers. As in previous RME models a signal difference of 1-R is equivalent to 6 db., and R-9 is equivalent to 100 microvolts input to the receiver. A signal should always be tuned so as to give a maximum reading on the meter. The meter should be adjusted to zero with the antenna disconnected by means of the screw on the rear of the chassis (See Fig. 2). It should be noted here that the accurate functioning of the CARRIER LEVEL meter depends on the setting of the R.F. GAIN control. The R.F. GAIN control should always be rotated to the maximum clockwise position and left there when it is desired to use the CARRIER LEVEL meter (this position is marked approximately by the designation AVC).

The CRYSTAL FILTER has two controls. The top control marked "XTAL SELECTIVITY" makes it possible to select the desired amount of selectivity for best results. Turning the control to "OFF" removes the crystal from the circuit. Rotating the control to the right changes the selectivity from a broad crystal characteristic at "1" suitable for phone reception to a razor-sharp characteristic at "5" for CW reception.

The CRYSTAL PHASING control should be adjusted to give minimum background noise. This setting will depend somewhat on particular conditions. This control may also be used to wipe out an interfering signal. Expert manipulation of the crystal filter usually comes only after a certain amount of practice.

An AUTOMATIC NOISE LIMITER is incorporated in the receiver circuit. No adjustment is required. The circuit is of a type that automatically adjusts itself to maximum effectiveness.

The action of the noise limiter is such that a slight amount of distortion is introduced on the signal. Therefore when it is desired to do so the noise limiter may be switched out of the circuit. This is accomplished by pulling "OUT" on the audio gain control. The shaft of this control floats and can be moved in and out with respect to the panel. When the knob is IN toward the panel the noise limiter is IN the circuit; when it is OUT from the panel the noise limiter is OUT of the circuit.

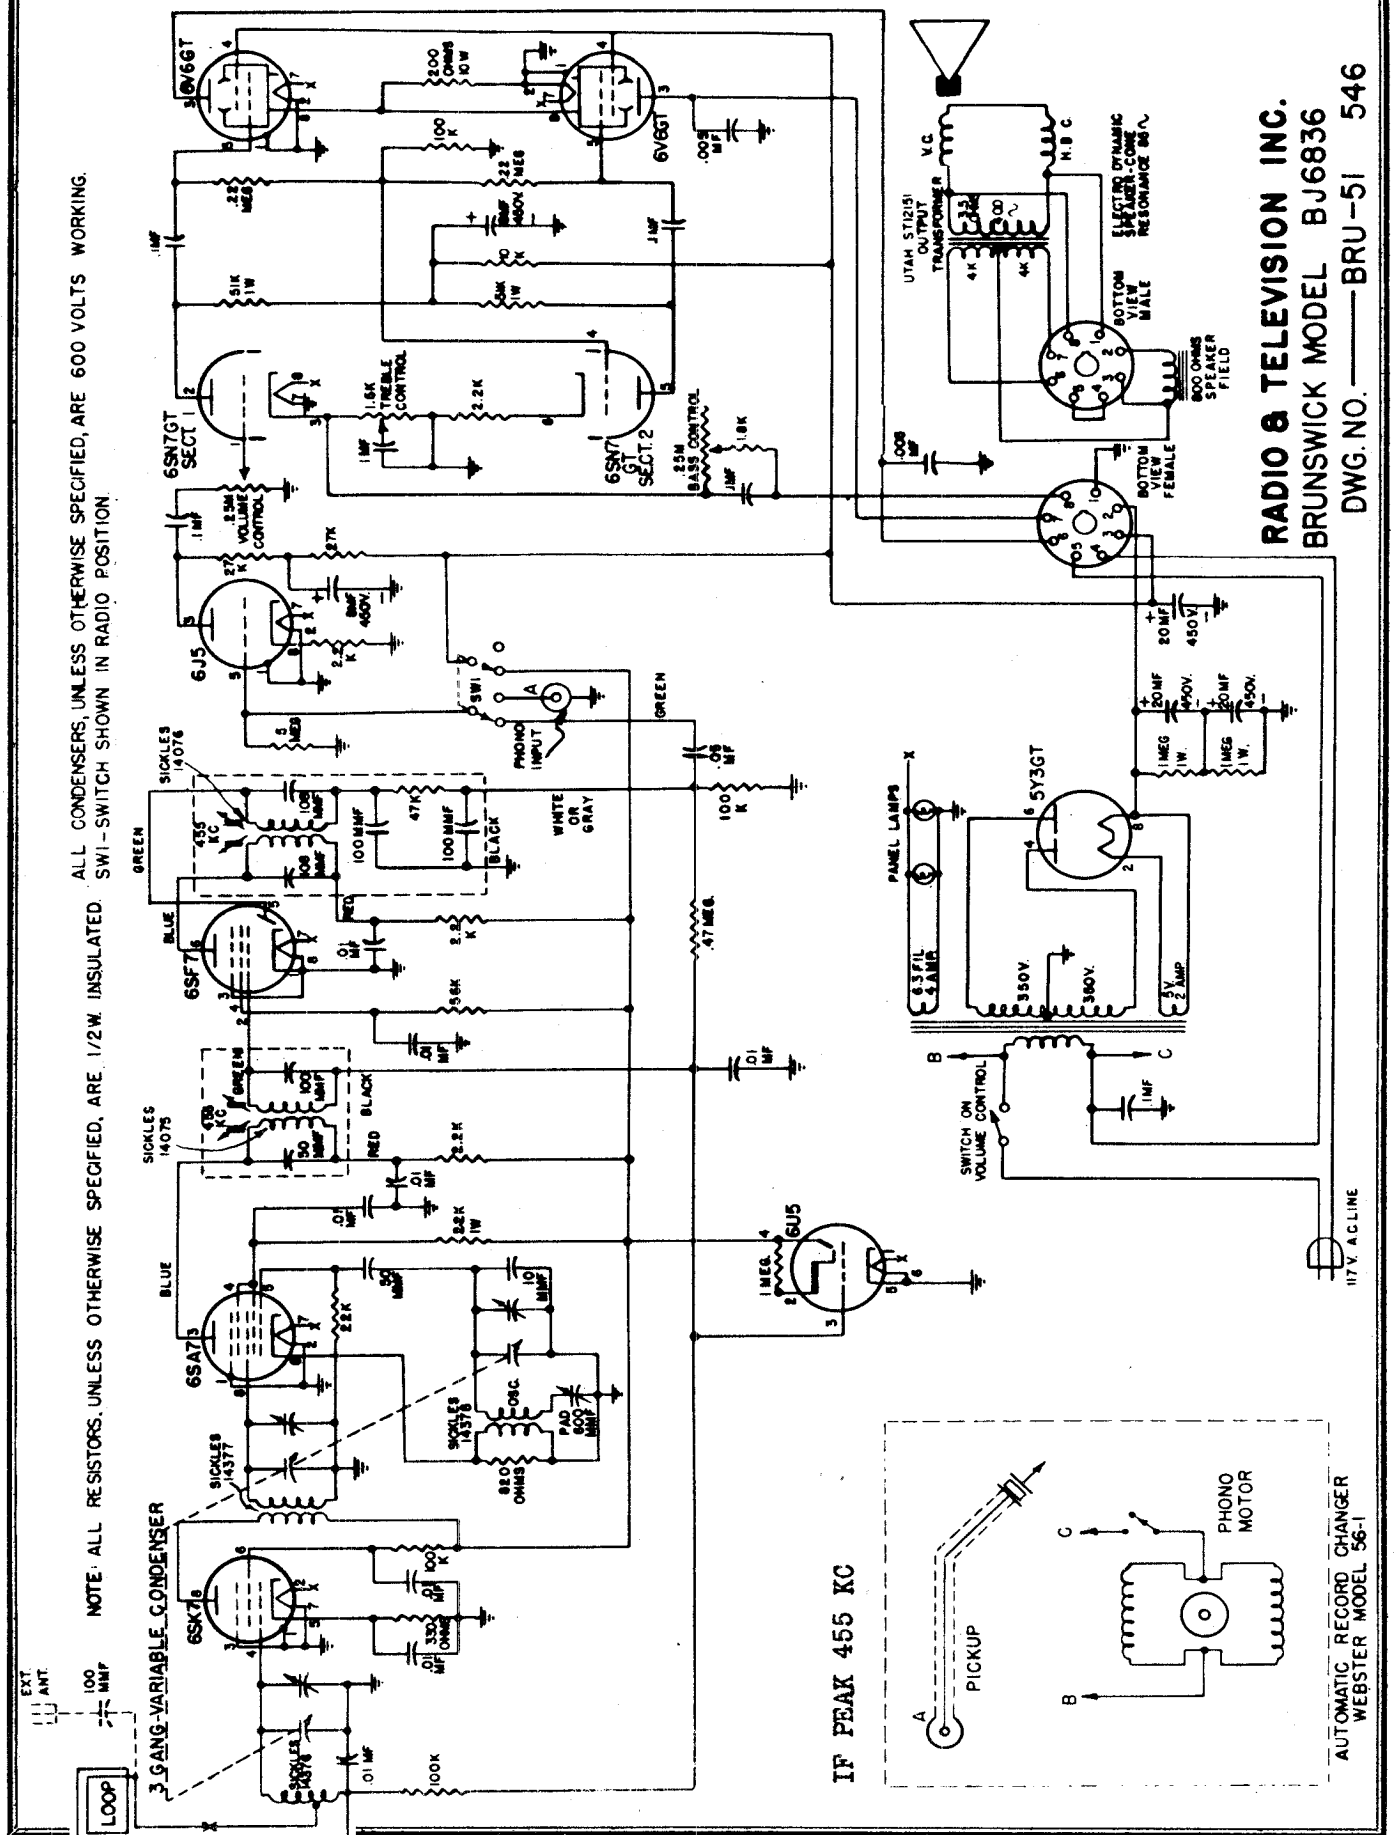
RADIO & TELEV. INC.

MODEL BJ-6836



Record Changer: Webster Model 56

©John F. Rider

POWER SUPPLY: 110 to 115 volts, 60 cycle A.C. only.
POWER OUTPUT: 14 watts.
POWER CONSUMPTION: 105-140 watts.

Amplifier output: 10 watts undistorted, 14 watts peak.

Amplifier gain: 72 db from phono input jack.

Frequency range: 530 KC to 1750 KC (566 to 171.4 meters).

Amplifier frequency range: 30 to 11,000 cycles.

Bass and treble controls are provided in the inverse feedback network.

A Webster Type 56-8 automatic record changer using a crystal pickup is built into the cabinet.

Alignment: The intermediate frequency used in this receiver is 455 kilocycles Connect Vacuum Tube Voltmeter capable of reading 20 volts negative DC to the AVC bus. This connection may be made at the black lead coming from the input IF transformer (#14075). The ground side of the meter will connect to the chassis. Connect output of Signal Generator to grid of converter tube (Pin #8). Adjust Signal Generator to 455 kilocycles. Increase output of generator until some deflection is noted on the Vacuum Tube Voltmeter. Carefully adjust IF transformer tuning slugs (screws in sides of cans) starting at output transformer for maximum reading on voltmeter. Repeat this process for best alignment. Remove Signal Generator allowing Vacuum Tube Voltmeter to remain connected. Connect output of Signal Generator to receiver loop in the following manner: Connect ground side of Signal Generator to receiver chassis. Connect live side of generator output to the loop lead which is knotted through a condenser of 100 to 500mmf.

Set receiver dial and Signal Generator to 600 kilocycles. Adjust oscillator padder for maximum reading on the Vacuum Tube Voltmeter. The oscillator padder is situated on the side of the RF tuner chassis beneath the amplifier chassis and is reached with a screwdriver having a shank at least 9" long. Care should be used in making this adjustment not to short circuit amplifier wiring beneath the chassis.

Turn the receiver dial to 1500 kilocycles and reset the Signal Generator to the same frequency. Adjust the oscillator trimmer (mounted on the rear section of the variable condenser) for maximum AVC voltage as read on the Vacuum Tube Voltmeter.

Proceed without readjusting receiver tuning or Signal Generator frequency to trim the RF coil and antenna coil by adjusting trimmers mounted on front two sections of the variable condenser. Adjust these trimmers for maximum AVC voltage.

Instructions for Removing Radio Chassis, Record Changer and Speaker

To remove radio set from cabinet proceed as follows:

1. Unscrew and remove back of radio compartment.
2. Pull out speaker plug from back of chassis.
3. Pull out Phono pickup lead at rear of chassis.
4. Remove the four screws from underneath bottom of radio compartment.
5. Disconnect Phono motor plug located underneath chassis compartment.
6. Disconnect aerial from loop.
7. Remove all knobs in front of chassis.

To remove record changer (only after chassis has been removed), unscrew the three bolts holding changer on motor board, lift out and pull gently the motor and pick up lead lines through rear cut out in Phono compartment.

Caution: When making these adjustments, the voltage output of the Signal Generator should be reduced to the point where the AVC voltage generated does not exceed 5 or 6 volts. Using larger AVC voltages may result in inaccurate alignment due to saturation and consequent broad tuning.

Service Notes: If replacement of components becomes necessary, lead dress may be disturbed and oscillation may result. The following lead dress should be observed:

1. Green wire on second IF transformer. Dress any slack toward chassis side away from oscillator coil and as close to chassis as possible.
2. 50 mmf. in oscillator grid circuit. Dress away from shield partition as far as possible.

In case of failure of input electrolytic condensers in filter, equalizing resistors (1 meg.) should be checked for value and replaced if more than 20% from coded value. Faulty resistors will result in improper voltage distribution across the condensers.

Powdered iron core in antenna coil is preset at laboratory for proper inductance and should not be readjusted. This core may not be present in all production runs.

The following is a table of operating voltages taken with 1000 and 20,000 ohms per volt meters. The receiver should be tuned between stations so no signal is being received during measurement.

Tube	Pin #	1000 ohm volt	20,000 ohm volt
6SK7	6(S)	70.0	80
	8(P)	220	225
	5(K)	2.0	2.25
6SA7	4(S)	70	75
	3(P)	205	215
6SF7	4(S)	70	75
	6(P)	200	200
6J5	3(P)	100	110
	8(K)	4.0	4.3
6SN7	2(P)	70	80
	3(K)	1.9	2.5
	5(P)	80	90
	6(K)	3.4	4.0
6V6	4(S)	210	215
	3(P)	190	200
	8(K)	14	14
6V6	4(S)	210	215
	3(P)	200	210
	8(K)	13.8	14.0
5Y3	2(F)	300	305
	8(F)	300	305
	4(P)	305 AC	
	6(P)	305 AC	
6U5	4(?)	200	205
	3(G)	0.25	0.6

To remove speaker (only after radio chassis and phonograph have been removed):

1. Remove phono motor board.
2. Unscrew rear panel of speaker compartment.
3. Remove four speaker nuts.

ALIGNMENT PROCEDURE

I.F. Alignment:- Connect a signal generator to the 6A7 input, and connect an output meter to the speaker output. Using a weak 480 Kc. signal tune the two I.F. condensers on the composite coil and the single I.F.condenser on the output I.F. coil for maximum response.

Antenna and Oscillator Alignment:- Connect the signal generator set at 1400 Kc. to the antenna lead using a dummy antenna of 150 mmfd. Tune the set by means of the dial to 1400 Kc. position. Adjust oscillator trimmer for this frequency. Then trim antenna stage for maximum response. Repeat the align-ment to insure accuracy and increased sensitivity.

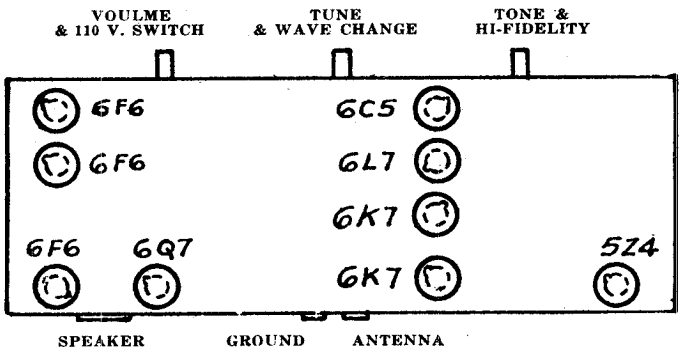

Fig. 1 Tuning Controls and Tube Position

ALIGNMENT PROCEDURE

. Correct alignment is of extreme importance in all-wave receivers. The receivers are properly aligned at the factory with precision equipment and realignment should not be attempted by the service technician until all other causes of faulty operation are corrected.

In order to properly realign the receiver the following equipment is necessary:

1. A signal generator which will provide an accurately calibrated signal at any frequency from 456 kilocycles to 18 megacycles. The generator should have adjustable signal output.
2. An output audio voltmeter of the low voltage type to be connected across the moving coil of the speaker. This should be capable of providing a readable deflection for relatively low output levels to avoid the effects of overload.
3. An insulated or non-metallic screw driver for the adjustment of trimmers.

I F ALIGNMENT 456 KC

1. Connect the output meter (low scale) across the loud speaker voice coil. Turn the wave band switch to broadcast position. Turn the volume control to its maximum position.
2. Connect the test oscillator ground to chassis and the "hot" lead from the test oscillator to the grid of the 6L7 converter tube through a series .1 Mfd. condenser. Set test oscillator to 456 KC.
3. Turn selectivity control (second from the left) to its high selectivity position. This is the left hand or counter-clockwise position.
4. Adjust I. F. alignment screws C17 and C18 of the output transformer to maximum output reducing output of test oscillator to keep meter reading on scale as alignment proceeds.
5. Adjust alignment screws, C15 and C16, of input transformer to maximum output as described above.
6. Readjust all four alignment screws to insure accurate alignment. Always use the lowest possible output from the test oscillator to preclude the possibility of automatic volume control action confusing proper adjustment.

R. F. ALIGNMENT BROADCAST BAND

1. With test oscillator connected to the antenna post through .00025 Mfd., set signal generator to 1600 KC.
2. Set travelite indicator to end of scale (beyond 550 KC calibration) with gang condenser fully meshed at maximum capacitance.
3. Set dial to 1600 KC. Adjust broadcast oscillator trimming condenser, C9, for maximum output meter reading.
4. Adjust detector input trimmer, C14, to a maximum.
5. Adjust antenna stage trimmer, C6, to a maximum.
6. Set test oscillator to 600 KC and tune in the signal, then adjust broadcast oscillator padder, C10, for maximum output. Rock the main tuning adjustment back and forth a degree or two in order to obtain proper maximum.
7. Repeat adjustments described under 3, 4, and 5 for greater accuracy.

POLICE OR SECOND BAND

1. Turn the wave switch to second or police band. Leave oscillator connected as above but with the output set to 5000 KC and the .00025 Mfd. condenser replaced by a 400 ohm resistor. Set dial scale to 5 MC on the second band. Adjust oscillator trimming condenser C8 for maximum output, observing as before that the proper point occurs at the minimum or counter-clockwise position of the screw as two points are found.
2. Adjust detector input trimming condenser. C13, to maximum, while rocking the tuning condenser slightly for maximum response.
3. Adjust antenna stage trimmer, C5, for maximum output.
4. Set test oscillator to 2000 KC and tune in the signal. Adjust oscillator padding condenser, C11, for maximum output, while rocking the tuning condenser as described above.
5. Repeat operations 1, 2 and 3 to assure precise alignment.

FOREIGN OR THIRD BAND

1. With the test oscillator connected the same as above and set to 16000 KC (16MC) set the dial to 16MC on the third band.
2. Adjust oscillator trimming condenser, C7, for maximum response. Use lower capacity or counter-clockwise response point.
3. Adjust detector input trimmer, C12, to maximum, rocking tuning adjustment.
4. Adjust antenna trimmer, C4, for maximum response.

I. F. Alignment. Connect a signal generator set at 480kc to the 6A7 input and connect an output meter to the speaker output. Using a weak signal tune the two I. F. condensers on the composite coil and the single I. F. condenser on the output I. F. coil for maximum response.

Connect the signal generator set at 1400kc to the antenna lead using a dummy antenna of 150 mmf. Tune the set by means of the dial to 1400kc position. Adjust oscillator trimmer for this frequency. Then trim antenna stage for maximum response. Repeating the alignment may result in improved sensitivity.

ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move needle to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) Have ground lead of test oscillator attached to chassis.

Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator: consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
I. F. alignment use any band position.	Any point where no interfering signal is received.	Exactly 455 K.C.	.02 Mfd. condenser	High side to grid cap of 6K8 tube. Do not remove cap.	Adjust each of the second I.F. transformer trimmers for maximum output—then adjust each of the first I.F. transformer trimmers for maximum output.
1730 to 540 K.C. Band	1 Exactly 1730 K.C.	Exactly 1730 K.C.	.00025 Mfd. condenser	Receiver antenna "A" post	Adjust 1730 K.C. oscillator trimmer for maximum output.
	2 Approx. 1400 K.C.	Approx. 1400 K.C.	.00025 Mfd. condenser	Receiver antenna "A" post	While rocking gang condenser adjust 1400 K.C. antenna trimmer for maximum output.
	3 Approx. 600 K.C.	Approx. 600 K.C.	.00025 Mfd. condenser	Receiver antenna "A" post	While rocking gang condenser adjust 600 K.C. oscillator padder for maximum output.
2.24 to 7.6 M.C. Band	1 Exactly 7.6 M.C.	Exactly 7.6 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	Adjust 7.6 M.C. oscillator trimmer for maximum output.
	2 Approx. 6. M.C.	Exactly 6. M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	While rocking gang condenser adjust 6 M.C. antenna trimmer for maximum output.
7.5 to 24 M.C. Band	1 Exactly 24 M.C.	Exactly 24 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	Adjust 24 M.C. oscillator trimmer for maximum output—be sure to use proper peak. If more than one peak is noticed, back off trimmer to minimum capacity, then screw down trimmer (add capacity) until the second peak—which is the proper one to use is tuned in.
	2 Approx. 20 M.C.	Approx. 20 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	While rocking gang condenser adjust 20 M.C. antenna trimmer for maximum output.

This 6-tube superheterodyne is designed to operate on 115 volts, 40 to 60 cycles, alternating current (AC) or 115 volts direct current (DC).

The tuning ranges, 533 to 1660 kilocycles (KC) and 5.3 to 18.3 megacycles (MC), cover all major Domestic and Foreign Short Wave Broadcast, Police, Aircraft and Amateur Bands.

For portable use, or where it is desirable to move the receiver from place to place frequently, the Built-in Loop Antenna furnishes excellent noise-free reception. This applies to the Broadcast Band Only. Where a permanent installation is made and it is desired to take full advantage of the performance capabilities built into this receiver, with particular reference to Short Wave reception, the use of a separate, outside Antenna is recommended. An antenna connection for this purpose is at the rear of the receiver.

The two control knobs are: Left, Volume Control and ON-Off Switch — Right, Vernier Tuning for both bands. The short wave band switch is located on the back of the receiver.

DIRECTIONS: Turn the receiver on and wait for tubes to reach operating heat. Adjust wave-band switch at the rear of the receiver to desired band. The upper half of the dial scale covers the Broadcast-Band — the Short Wave Band is on the lower half. Turn the vernier tuning knob until the desired station (see dial pointer) is heard. Adjust volume to a satisfactory level, first making sure that the station is tuned in correctly. Tuning on the Short Wave is critical; use greater care or many worthwhile programs might be passed over unnoticed.

If the receiver fails to operate on DC current, reverse the power cord plug. On AC a hum may be heard in the background of the program. This may, in some cases, be eliminated or reduced by reversing the power cord plug.

One 6-8 volt 150 MA lamp is used to illuminate the dial. A similar lamp should be used for replacement or damage may result.

ALIGNMENT PROCEDURE

Volume Control-Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The equipment in column at right is required for Aligning:

Signal Generator which will provide an accurately calibrated signal at test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

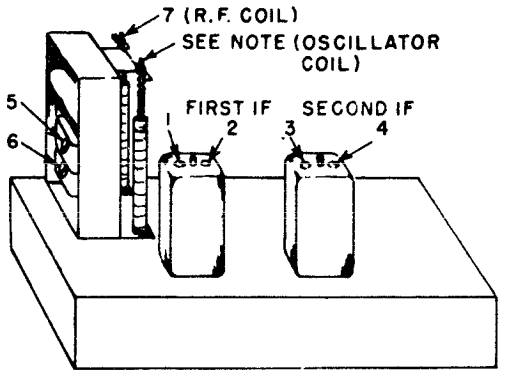
Dummy Antennas-.01 mf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	ANTENNA CONNECTION	COUPLING	DUMMY ANTENNA	TUNER SETTING	TRIMMER ADJUSTMENT (SEE DIAGRAM)	NOTES
I.F. 455 KC	Grid of RF tube 12SK7	Ground generator to chassis	0.01 mfd	Out	Adjust for Max. 1, 2, 3 and 4	No signal will be heard unless trimmer condenser under chassis is unscrewed and reduced from original setting
I.F. 455 KC	Grid of RF tube 12SK7	Ground generator to chassis	0.01 mfd	Out	Trim condenser under chassis for Min. output.	If it is found that regeneration prevails when the loop antenna is put in its normal position close to the tubes, then the under chassis trimmer is incorrectly set, and should be adjusted to prevent the regenerative condition.
1620 KC	Inductive Coupling to Loop	Loop coupling with leads brought out	400 ohms in series with Antenna & Gnd.leads	Out	Adjust Osc. #5 per Max. signal	
1400 KC	Inductive Coupling to Loop	Loop coupling with leads brought out	400 ohms in series with Antenna & Gnd.leads	Dial set for 1400KC	Adjust RF trimmer #6 per Max. Signal.	
700 KC	Inductive Coupling to Loop	Loop Coupling with leads brought out	400 ohms in series with Antenna & Gnd.leads	Dial set for 700KC	Adjust RF tuning core #7 for Max. (care should be taken not to disturb carriage position of tuner)	If more than one turn is required, the trimming 1400 KC should be repeated and the 700 KC padding of the tuning core also repeated until correct alignment has been reached

SPECIFICATIONS

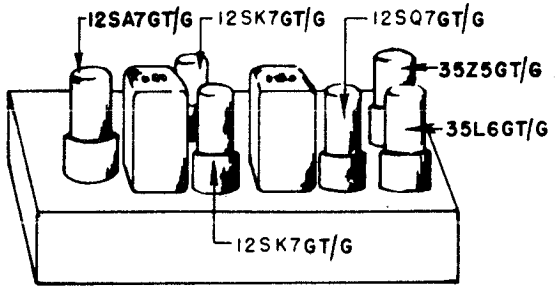
Power consumption..... 35 Watts
(At 117 volts AC Supply)
Power Output- 1.1 Watts 10% Distortion

Selectivity----49 KC Broad at
1000 times Signal
Intermediate Frequency..... 455 KC
Speaker..... 5" PM Dynamic
Tuning Frequency Range..540 to 1620 KC
Sensitivity (For .05 Watt output-external Antenna) 20 microvolts average



CAUTION - If a dial lamp burns out, it should be replaced at once.

Use ONLY a No. 47 dial lamp. Replace through bottom of cabinet.



©John F. Rider

ALIGNMENT NOTES

A. MECHANICAL ALIGNMENT:- The following mechanical adjustments should be made before alignment:

1. Rotate shaft of tuning unit until carriage is against top stop position.
2. Space oscillator coil slug 1-5/32" out from top of oscillator coil form.
3. Space R.F. coil slug 1-29/64" out from top end of R.F.coil winding. (Note:-The distance 1 and 2 should be measured from mounted end of the slug)
4. Adjust screw on trimmer of wave trap towards open position so that condenser plates are open at least 1/32".

B. I.F. ALIGNMENT PROCEDURE

1. Feed I.F. frequency from the signal generator through a 0.01 mfd condenser to the control grid of the R. F. tube.
2. No signal will be heard unless trimmer condenser under chassis is unscrewed and reduced from original setting.
3. Turn volume control full on.
4. Make preliminary I.F.adjustment with signal level approximately 50 Mv.
5. Tune I.F. trimmers for maximum signal, reducing I.F. signal input to coupling loop to keep output voltage less than 0.5 V.
6. When maximum output has been secured, adjust trimmer condenser in the I.F. trap (under chassis) by turning clockwise to the minimum signal.

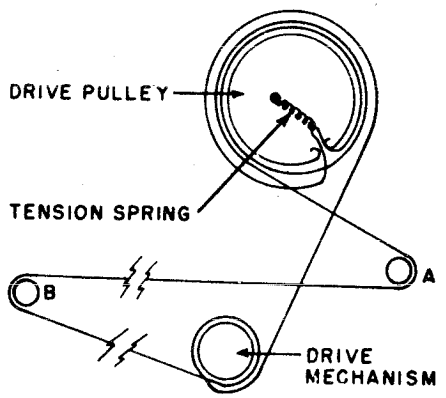
C. R.F. ALIGNMENT PROCEDURE

1. Volume control full on.
2. Adjust tuning unit to top stop position.
3. Feed 1620 kc signal into external loop. Hold audio output below 0.5 V. Adjust the oscillator trimmer condenser to maximum output.
4. Move slugs in by means of tuning dial so that pointer is approximately 1" from the stop end, and a signal received from the external loop on a frequency of 1400 kc. Adjust lower trimmer (R.F. trimmer) to maximum output. Reduce R.F.input to keep signal output voltage below 0.5 V.
5. Rotate tuning shaft until pointer is approximately 1" from the other end of the scale. Feed to the external loop a test signal at 700 kc. Adjust the R. F. coil slug by rotation to maximum output.

NOTE: If more than one complete turn of the slug is required to obtain maximum signal, return tuner to 1400 kc. position and repeat steps 4 and 5.

If less than one turn is required to obtain the maximum 700 kc. audio output, the R.F. alignment may be considered complete.

CAUTION: Extreme care should be taken in the 700 kc. position to make sure that the tuner carriage is not moved by the adjusting tools or hand pressure on the slug screw. Carriage should not be held against the frame, but should be allowed to assume its normal position when adjusting the R.F. coil slug.



DRIVE CORD REPLACEMENT

Turn the tuner to the fully open position. Use a new cord 50" long and tie one end to the tension spring. Fasten the other end of the tension spring to the drive pulley. Pass cord through slot in pulley ring; add spring tension and continue one and one-half turns counterclockwise over top of pulley Then pass cord around idler pulley A, starting over top and going around clockwise. Pass cord over idler pulley B, starting over top and going around counter clockwise. Wind one full turn counterclockwise around drive mechanism. Then wind one full turn counterclockwise around drive pulley, pass through slot in pulley and tie string to tension spring. Cut off excess string.

Attach dial pointer to cord.

ALIGNING PROCEDURE

Align I.F. Trimmers at 455 KC.

1. Turn dial to extreme high frequency end.
2. Set signal generator to 1650 kc.
3. Adjust osc. trim. to secure signal.
4. Adjust R.F. trim. to secure maximum sig.
5. Set signal generator to 1400 kc.
6. Turn dial to secure signal.
7. Check R.F. saddle to see output at maximum.
8. Adjust saddle to secure max. output, if necessary.
9. Recheck alignment at 1650, re-adjust R.F. trim.if necessary.
10. Set signal generator to 600 kc.
11. Adjust dial to secure signal.
12. Rock dial while adj. shunt pad for max signal.
13. Realign osc. and R.F. trimmers at 1650.
14. Recheck 1400 kc to 600 kc points for alignment.
15. Repeat procedure from step 5 on if 1400 and 600 are out much.
16. Set signal generator to 1000 kc.
17. Tune in signal.
18. Install pointer "Set to 100" on dial.

SERVICE DATA

UNDERSCORED FIGURES ON THE DIAGRAM ARE AVERAGE VOLTAGES FROM THAT PARTICULAR POINT OF THE CIRCUIT TO THE CHASSIS. THESE VOLTAGES ARE FOR A 117 VOLT LINE, AND WITH THE SET TUNED TO NO STATION.

NOTES

1. RESISTORS 1/4 WATT UNLESS OTHERWISE NOTED.
2. CONDENSERS 600 VOLT UNLESS OTHERWISE NOTED.
3. HEATER CONNECTIONS OF TUBE 6SQ7 ARE 8 AND 7.

REMLER
CO. LTD.

MODEL MP5-5-3
RADIO RECEIVER
110-120 VOLTS 50-60 CYCLES
50 WATTS

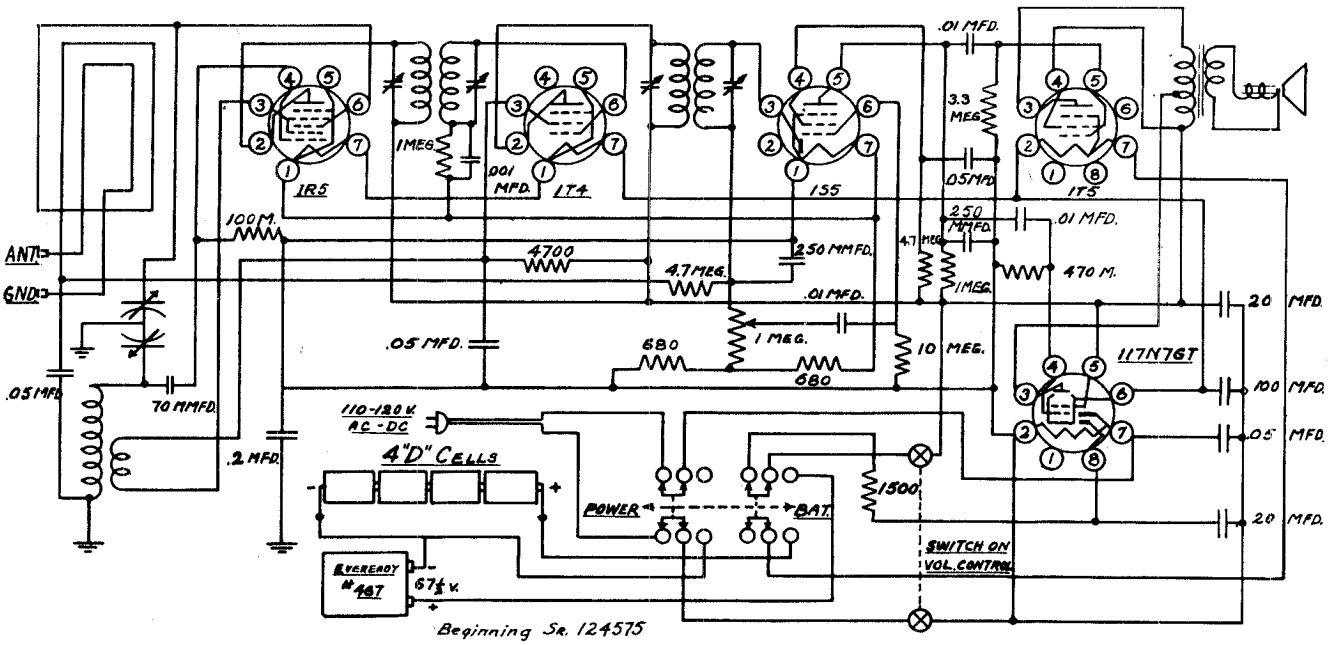
IF PEAK 450 KC

THE INTERMEDIATE FREQUENCY IS 450 KC. OTHER ALIGNMENT FREQUENCIES ARE INDICATED ON THE DIAGRAM. THE FREQUENCY RANGE OF THE RADIO IS 540-1730 KILOCYCLES.

A FUSED PLUG IS ATTACHED TO THE POWER CORD OF SOME SETS. FUSES MAY BE REMOVED BY INSERTING A SMALL DIAMETER INSTRUMENT (PENCIL, STIFF WIRE, ETC.) IN THE PRONG END OF THE PLUG. IN NO CASE SHOULD A FUSE OF GREATER CAPACITY THAN 3 AMPERE BE USED. LOWER CAPACITY FUSES SUCH AS 1 AMPERE MAY BE USED. LOWER CAPACITY FUSES SUCH AS 1 AMPERE MAY BE USED, BUT LOWER CAPACITY TYPES MAY BURN OUT MORE FREQUENTLY ON CURRENT SURGES NORMALLY ENCOUNTERED WHEN THE SET IS TURNED ON.

MODEL 440

REMLER CO. LTD.



The chassis may be removed from the cabinet by removing the knobs and taking out the three binding head screws in the bottom of the cabinet. The oscillator trimmer is located on the front section of the variable condenser, while the converter, or loop, trimmer is on the rear section. I. F. trimmers are accessible in the tops of the I. F. transformers. The I. F. frequency is 455 KC. Standard alignment procedure is applicable.

TUBES

A combination of battery-type and power tubes is used. The battery type output tube is not in use when the set is operated from a power source.

The receiver is equipped with:

1S5-diode detector and A. F. amplifier
1R5-converter
1T5Gt-output tube for battery operation
1T4-I. F. amplifier
117N7GT-output and rectifier for power operation

The following voltage readings are taken with a 1000 ohm per volt meter.

BATTERY OPERATION

Fresh batteries-no signal

SCOTT FM CONVERTER

Description

The Scott FM Converter is provided to enable the listener, with an FM Receiver having the old FM band of 41-50 megacycles, to tune in stations on the new FM band of 88-108 megacycles. The FM Converter is provided with a single control consisting of a four position switch which should be located on the front of the cabinet as outlined under INSTALLATION. The first three positions of this control are used for tuning in FM stations on the 88-108 megacycle band while the fourth position is used for tuning on the 41-50 megacycle band.

The FM Converter utilizes three type 717A high frequency pentode vacuum tubes in a circuit which consists of a tuned RF amplifier, mixer and H.F. oscillator.

An adapter plug is provided with the converter in order that power for the tubes can be obtained without having to make connections inside the receiver. One of the power output tubes of the receiver is removed and the adapter plugged into this socket, the tube is then inserted into the adapter.

Terminals are provided on the FM Converter for connection of an antenna, and a shielded high frequency cable is provided for connection of the converter to the FM antenna terminals of the receiver.

The FM Converter unit is 7 3/4 inches long with a 1/4 inch diameter shaft extending 2 inches at the front end. The unit is 4 3/4 inches wide and 2 3/4 inches deep. The power adapter cable extends approximately 4 1/2 feet from the unit while the antenna cable extends 3 feet from the unit.

Installation

The FM Converter Kit contains all the items necessary for complete installation of the converter in the cabinet housing the radio receiver. The installation should be made as follows:

1. Select the location in which the converter is to be mounted, in most cabinets the upper right hand corner will be found most convenient, but any location which is accessible will do. Any number of mounting arrangements can be worked out with the two brackets furnished using the two sets of mounting holes and the switch shaft bushing. The arrangement shown in Figures 1 & 2 can be used in most installations. Screws are furnished, in the kit, for fastening the brackets to the converter and wood screws are furnished to fasten the brackets to the cabinet.

2. After selecting the position in which the converter is to be mounted, mark the location of the hole for the switch shaft and carefully drill a 1/2 inch clearance hole. Then fasten the brackets to the cabinet letting the switch shaft extend approximately 1/2 inch out of the front of the cabinet.

3. Fasten the escutcheon plate to the front of the cabinet using the four small block screws provided and fasten the knob on the switch shaft so that the pointer is set at No. 4 position when the switch is set in the extreme counter-clockwise position.

4. Remove one of the power output tubes (6V6G or 6L6G) and insert this tube into the converter adapter socket. Then insert the adapter plug into the socket of the receiver from which this tube was removed.

5. Remove the antenna lead-in from the FM antenna terminal strip of the receiver, connect the center terminal of this strip to the ground terminal with a short piece of wire and then connect the insulated center wire of the converter antenna cable to the open antenna terminal and the shield braid of this cable to the ground terminal of the receiver FM antenna strip.

Antenna Installation

In order to obtain the best results when using this converter on the 88-108 megacycle band, a dipole antenna cut to the proper length with a 300 ohm low-loss lead-in should be used. This antenna may be one of several designs as follows:

a. When the receiver is located 30 or more miles from the transmitter it is recommended that a dipole antenna with reflector be installed outside and as high as possible. The Scott Type 1B887 FM Dipole Antenna Kit will fulfill all requirements for such an installation. It is supplied with antenna and reflector elements cut to the proper length for the 88-108 megacycle band, a molded bakelite block for mounting these elements, a steel support mast with universal mounting bracket and 75 feet of 300 ohm high frequency lead-in cable. This antenna should be installed with the elements broadside to the transmitter with the reflector element in back of the dipole elements.

b. For installations within a 30 mile radius of the transmitter a straight dipole antenna without the reflector can be used, however if an outside dipole antenna is to be used the dipole antenna with reflector will give best reception.

c. For installations where an outside antenna cannot be installed a very simple antenna, that will give good results when the receiver is located within a 30 mile radius of the transmitter, can be constructed from 300 ohm twin-lead. This antenna can be mounted on the rafters of the attic or fastened around the back of the receiver cabinet. This antenna is constructed as follows:

   1. Cut a piece of 300 ohm twin-lead 59 inches long, skin back the wires at both ends approximately 3/8 inch and solder the two wires together at each end. You will then have a flat piece of cable approximately 58¼ inches long shorted at both ends.

   2. Measure off the exact center of the cable and cut through one of the wires only. Skin back the two wires approximately 1/4 inch, then solder on a length of 300 ohm twin-lead long enough to reach from the antenna to the receiver. This lead-in may be any length depending upon where the antenna proper is to be installed.

SCOTT RADIO LABS. INC.

3. After the antenna has been installed the two wires of the lead-in should be connected to the two terminals of the strip at the rear of the converter marked "ANT.". The ground terminal need not be used.

Operation

Since power will be applied to the converter at all times when the receiver is turned ON, all that is necessary to put the converter in operation is to set the receiver controls for FM reception. With the converter control set at Position 4 the receiver will tune in FM stations between 41-50 megacycles as it normally would. To tune in any FM station on the 88-108 megacycle band, set the converter control to the position under which the frequency of the station is listed and then tune the dial of the receiver to the frequencies listed under column 4. For example: If it is desired to tune in a station at 98.9 megacycles the converter control should be set at position 2 since this frequency lies between 98 and 99 megacycles, the receiver dial should then be tuned between 46 and 47 megacycles as indicated in column 4. If the station desired operates on 102.5 megacycles the converter control should be set at position 1 and the receiver dial tuned between 42 and 43 megacycles as indicated in column 4. It will be found very helpful if a chart is made listing the reading on the dial logging scale for each FM station in the location where the converter is being operated.

Maintenance and Repairs

Since there are no moving parts in the FM Converter outside of the switch control, it will require little maintenance. Tube replacement is minimized by using the same type of tube in all three positions.

The schematic circuit diagram, Figure 4 and the list of replaceable parts, Table 1 will help in making any repairs necessary.

Alignment

The following alignment instructions are provided in order that the FM Converter may be correctly realigned in case it is necessary to replace any part that will affect alignment.

Before realigning the FM Converter the calibration of the 41-50 megacycle band on the receiver must be checked since the accuracy of this calibration will affect the calibration of the FM Converter as listed on the converter control escutcheon.

Align the FM Converter as follows:

Connect a signal generator, capable of covering the 88-108 megacycle band, to the antenna and ground terminals of the FM Converter using a 50 ohm composition resistor in series with the high potential lead of the signal generator and connect an output meter across the voice coil of the speaker to be used as an indicator.

CAUTION: The trimmer adjustments must be aligned in the sequence outlined below as trimmer capacitors C1, C9 and C14 are used as part of the capacity required for alignment on positions 2 and 3.

1. Set the controls on the receiver for FM reception with the tuning dial set at 47 megacycles.

2. With the signal generator adjusted to 107 megacycles, set the switch control of the FM Converter to position No. 1 and adjust trimmer capacitor C14 until the signal is tuned to resonance, then adjust trimmer capacitor C9 and C1 for maximum indication on the output meter.

3. Set the signal generator to 99 megacycles and the converter control to position No. 2. Adjust trimmer capacitor C15 for resonance; then adjust trimmer capacitors C10 and C2 for maximum indication on the output meter.

4. Set the signal generator to 90 megacycles and the converter control to position No. 3. Adjust trimmer capacitor C16 for resonance; then adjust trimmer capacitors C11 and C3 for maximum indication on the output meter.

NOTE: When making the above adjustments the receiver dial must be set at 47 megacycles at all times.

Do not readjust trimmer capacitors C1, C9 and C14 after positions No. 2 and 3 have been aligned as the initial setting of these trimmers will affect the alignment of these two positions.

ELECTRICAL DESCRIPTION OF THE CIRCUIT

R.F. SECTION

The antenna input circuit is arranged so that when operating on the two shortwave bands and broadcast band, the signal picked up on the flat top portion of the doublet antenna is transferred to the R.F. tube grid by means of the special shielded ring coupling system, achieving a high degree of noise reduction. Noise reduction is also achieved on all bands due to the use of a special filter at the antenna. On the police band the signal is fed directly into the primary coil to minimize circuit loss. The first tuned circuit resonates and amplifies the desired signal. On shortwave and police the second tuned circuit operates directly from the plate of the R.F. tube and feeds directly into the converter grid reducing losses to a minimum. A 6U7G tube, having high mutual conductance is used in the R.F. stage which gives high sensitivity on all bands.

CONVERTER SECTION

The amplified signal from the R.F. amplifier is applied to the 6L7G converter control grid and the oscillator output is coupled to grid No. 3 These two input signals now both modulate the converter cathode emission and the result will be a difference in frequency component in the plate circuit of the converter which represents the I.F. frequency.

OSCILLATOR SECTION

The proper combination of series padders, shunt trimmers, and coils in the oscillator circuit provide a signal frequency 455 Kc. higher than that to which the R.F. section is tuned. (in special cases individual I.F. frequencies are used.) The efficient 6J5G type oscillator tube is used in an electron coupled circuit. Oscillator potentials are carefully by-passed and filtered, and the circuit is made extremely stable by the use of Silver Cap condensers and a special metalized resistor.

I.F. SECTION

The I.F. amplifier consists of three stages employing two 6K7G tubes and one 6B8G tube. the I.F. transformers are wound in single pi sections in both primary and secondary coils, and are permanently tuned by a combination Silver cap fixed condenser and an iron core giving a micrometer adjustment. In addition, each stage is arranged with resistance capacity filters for each circuit. The I.F. system is arranged for three degrees of selectivity by means of a small tapped coil connected to the grid return of the I.F. secondary and closely coupled to the primary in the 2nd and 3rd stage. The degree of coupling is then controlled by varying the selectivity switch. The signal developed in the converter plate circuit is highly amplified in the I.F. amplifier at 455 Kc. and is passed to the second detector.

R.F. and I.F. AVC SYSTEMS

The Scott Phantom Deluxe employs two separate AVC systems. In the R.F AVC circuit the control grid of the 6B8G tube is capacitively coupled to the plate of the 6L7G converter tube I.F. and signal frequency are amplified and rectified by this tube and applied as control on the 1st R.F. grid and converter tube. This prevents overload in the R.F. stage and helps to reduce the effects of noise and distortion when tuned to powerful locals and also protects the first tube from these effects when the set is tuned to a weak distant station that is near in frequency to a powerful local. This AVC action operates only when the input signals exceeds about 1,000 microvolts.

In the I.F. AVC circuit the 6B8G tube acts as I.F. amplifier and diode detector and supplies AVC voltage for control on the 1st and 2nd I.F. tube grids and prevents overload and distortion in this part of the circiut.

Just below the Selectivity Control is the sensitivity Control which will decrease the maximum sensitivity of the receiver, when to extreme left, by increasing the minimum bias of the I.F. tubes. This provides silent tuning between stations but in no way effects the normel AVC action on the stations which are well above the noise level.

DETECTOR

As mentioned above, the 6B8G tube acts as a second detector in addition to its other functions, and handles high percentage modulation signals with a minimum of distortion

RECORD SCRATCH SUPPRESSION

The Scott Phantom DeLuxe employs the feature of automatic scratch suppression using a 6B8G and a 6J7G in a special circuit which attenuates the higher audio frequencies (corresponding to record scratvh) when they are very weak, but passes unattenuated the stronger high frequencies (corresponding to useful high fidelity reproduction).

The 6B8G tube operates as an amplifier and diode to supply rectified bias voltages (proportional to input signal amplitude for frequencies above 1,500 cycles) to the control grid of a 6J7G tube The circuit is arranged so that the effective capacity of a 35 mmd. condenser, amplified to a maximum of approximately 3,000 mmf. by the gain of the 6J7G tube, is in shunt with the first A.F. 6K7G tube grid at audio frequencies.

When the highew audio frequencies are weak no rectified bias is developed by the 6B8G tube allowing the 6J7G tube to operate at maximum gain, shunting a high capacity from the grid of the first AF tube to ground, thus practically eliminating record scratch. However, when the higher audio frequencies are strong, considerable rectified bias is developed in the 6B8G tube and applied to greatly reduce the gain of the 6J7G tube, thus reducing the effective capacity, shunting the input to the first A.F. tube and allowing all frequencies to pass unattenuated.

AUDIO AMPLIFIER

When the selectivity switch is set to position "P" the input to the three stage audio system is automatically connected to the phonograph input terminals on the rear of the chassis. The volume control regulates the input to the 6K7G first audio tube and in the plate circuit of this tube the variable bass and treble control circuits are connected. The bass circuit utilizes a high "Q" resonator choke system and provides a boost of about 15 db. at 75 cycles in the maximum position.

The first audio tube is followed by the 6J5G phase inverter tube. This circuit is self balancing and couples into the grids of the 6J5G pushpull 2nd audio tubes which operates into the balanced primary of a special driver transformer, the secondaries of which in turn apply the signal to the 6L6G beam power output stage.

The power output stage incorporates inverse feed backwhich helps to flatten loudspeaker response and improves reproduction.

NOISE LIMITER CIRCUIT

A 6H6G tube is utilized as a noise limiter device so that peaks of local electrical interference may be "chopped" off resulting in reduction of peak noises of continuous amplitude. You will find this especially effective when the receiver is tuned to a weak signal on shortwaves.

POWER SUPPLY

The power supply used is of the heavy duty type employing two of the new 5U4G rectifier tubes. The primary of the power transformer is arranged for standard 117 volts on the domestic model. On the foreign model it is designed to accomodate either 117 volts or 230 volts AC by proper placement of the fuses. This is clearly shown on the schematic diagram. The rectified plate voltages are filtered by the use of three high capacity electrolytics, a choke and the speaker field employed as another choke. In addition, the bias voltage is further filtered by the use of a 100 mfd. condenser at 50 volts.

LOUD SPEAKER

The loud speaker employed is arranged to provide connections for an external speaker. It is necessary to disconnect the jumper wire between terminals V.C. and 38, and connect it between V.C. and 19 instead Now connect a 38 ohm speaker to the terminals marked 19 and G. "T" pads may be added by reference to the diagram showing these connections.

©John F. Rider

TESTING THE SCOTT PHANTOM DELUXE

In order to properly align and service the Scott Phantom DeLuxe receiver, the serviceman must have the following equipment.

Signal Generator (90 Kc. to 60 Megacycles)
Output Meter (such as Weston or Triplett)
Voltmeter and Ohmmeter (Sensitivity 1,000 ohms per volt or better.)
Microammeter (Weston model 600)
Tuning Wand (Alladdin)
Audio Oscillator (30 to 10,000 cycles)

HUM TESTS ON RECEIVER

Make certain that there are no soldering irons near the chassis and that the power transformer end of the amplifier is as far away as possible. Connect a good output meter, having a resistance of 3,000 ohms or more to the 6L6 plates (No. 3 prong) and have a 1 to 2 mfd. condenser in series with one lead to another.

With bass full on, treble full, and volume off, the hum should not exceed .1 of a volt. To make overall tests, remove the 2nd audio 6J5G tubes. The hum should now drop to less than 0.1 volt. If it does not, the amount of hum read on the meter is the hum in the amplifier itself. Leave the tubes just removed out and change the 6L6 tubes in the amplifier, at the same time adjusting the hum control on the amplifier until the hum is reduced to a minimum. There may be a filament short also. Check the circuit and connections to get the hum out of the amplifier before proceeding with the rest of the test.

NOTE: It is highly important, in minimizing hum to use the Spiral Heater type 6K7G and 6J5G tubes in the audio system since while considerable bass boost is available, tubes are the sole source of hum, there being no hum pickup whatsoever in chokes, transformers, etc.

After the amplifier is found to be OK replace the 2nd audio tubes and remove the inverter and 1st audio, substituting a new tube for the 2nd audio tube to heat up properly. Next try the inverter tube in the same manner and follow with the 1st audio 6K7J; also, the dial light circuit may be shorted against the dial frame. All these points should be checked along with the trying of new tubes.

AUDIO GAIN TESTS

With an audio input signal of 0.5 volt at 400 cycles an output reading of between 22-24 volts should be obtained on the output meter which is connected across the voice coil. Make this test with volume full, bass control full, selectivity in phono position. If this gain is low it may be due to defective tubes, wrong voltages, shorts or open circuits, either in the set or power amplifier. Both should be checked.

AUDIO FIDELITY TESTS

For correct high fidelity reproduction it is important that the electrical frequency response of the audio system, from the phono posts to a 38 or 40 ohm dummy voice coil resistor approximate 2 2.4 volts at 75 cycles and a 3-3.5 volts at 6,250 cycles with the bass and fidelity controls on full, after the output has been carefully adjusted, by means of the volume control, to 1 volt at 400 cycles with an input of 1 volt at each frequency. Failure of the system to approximate this response (if you are certain that your meters are accurate and that no series meter condenser which would "cut" low frequencies, is being used) should lead to analysis of the low or high frequency circuit involved to determine and eliminate the trouble.

HOW TO ADJUST THE AUTOMATIC RECORD SCRATCH SUPPRESSION CIRCUIT ON THE SCOTT PHANTOM DELUXE

Connect an output meter across the voice coil circuit (V.C. to G.) Connect an audio oscillator and a sensitive output meter to the phono posts, and turn the selectivity to position "P" (all way to right). With the bass control set to minimum treble control full on, and scratch suppressor switch off, apply 0.2 volt at 3,500 cycles to the phono posts. The scratch suppressor switch is ganged with the sensitivity control. Set the volume control so that 1 volt is obtained on the output meter across the voice coil. Turn on (to right) the suppressor switch and the 1 volt reading should just start to drop (say to .9v.). Now turn the suppressor switch off and reduce the audio oscillator input to 0.05 volts, reset the volume control to obtain a 1 volt reading again on the voice coil output meter and now turn on the suppressor switch. The 1 volt reading should now drop to a level of 0.3 of a volt or slightly under. This gives a reduction ratio of 5 to 1 and this is the proper ratio to mamtam. If this 5 to 1 reduction is not obtained the 6 volt bias should be reduced slightly by varying the small slider arm in the C divider network. If too much control is obtained, the 6 volt bias may be raised by adjusting the slider arm.

The 6B8G tube determines the level at which the circuit starts to cut high frequencies and the 6J7G tube determines the amount of this out.

ALIGNMENT OF I.F. SECTION

Connect a good signal generator to the input of the I.F. system. Turn the wave band switch to the broadcast band; have sensitivity control to maximum position (to right); turn tuning dial pointer to hi-freq. end of dial. Ground the I.F. AVC line by connecting a jumper wire from it to Gnd. Now set the the selectivity switch in the sharp position (all the way to the left).

Connect the negative terminal of a 20,000 ohm per volt DC voltmeter using the 25 volt scale, (or a sensitive microammeter with a 0.5 meg. resistor connected in series with its negative terminal) to the "I.F. Diode Output Point", and connect the positive terminal to the chassis.

Apply an unmodulated 455 Kc. signal of sufficient strength to produce a diode output voltage reading of approximately 10 v. (or 20 microamperes for the microammeter) and very carefully adjust the 1st, 2nd, 3rd, I.F. transformer and I.F. diode trimmers for maximum meter reading, reducing the input, if necessary, to avoid exceeding the above figures.

Adjust the R.F. diode transformer for maximum output after the I.F. stages are aligned. Remove the 1 meg. resistor from ground that is connected to the R.F. diode output point (10,000 Ohm) and put the high resistance DC meter in series with the 1 meg resistor to groond, the positive side of the meter going to ground. If there is sufficient signal from the generator it will be OK to merely connect the negative terminal of the microammeter to the R.F. diode output point. Put in a strong signal until a variation is noticed and adjust the R.F. diode for maximum output. Adjust the diode trimmers very carefully. Also shunt out the coil you are not adjusting, with a 10,000 ohm resistor while trimming the other circuit; namely, put 10,000 ohms from B. to the 6B8G plate then trim the secondary. Shift the resistor to diode plates and 10,000 ohm diode output point and trim the primaries.

ALIGNMENT OF R.F. SECTIONS

Before starting on this portion of the set, it is important to understand how the tuning wand works. One end of this device has a core of material such as polyiron while the other end is brass. When the inductance of a coil is high, insertion of the brass end will decrease it to the proper resonant value; whereas, insertion of the other end will increase the effective inductance.

This gives a very conveinient means of determining whether or not it is necessary to add or remove turns from the coil. In the following instructions only a slight adjustment of trimmers and padders should be necessary where original coils are used. Full instructions however, are given to cover the case where new coils are to be used

BROADCAST BAND ALIGNMENT

First turn the dial pointer completely to the low frequency dial stop and see that the pointer reaches 1/16" beyond the lowest frequency mark. Turn the wave band switch to the broadcast "A" position, set the bass control to minimum, treble control to maximum and sensitivity control to minimum and connect an output meter across the voice

©John F. Rider

coil. Adjust oscillator trimmer C1, until a 1,400 Kc. signal is set on the dial is tuned in from the generator. Rotate the dial to 600 Kc. and tune in a 600 Kc. signal from the generator by adjusting the padding condenser C3. Check the dial at 950 Kc. and if it tunes high in frequecny spread turns on the oscillator secondary, if it is low in frequency push the turns together **and then readjust trimmer condenser C1, and** padder condenser C3 as before.

With the oscillator circuit correctly spotted, tune in a signal from the generator at 1,400 Kc. and use the output meter as indicated.

Have as weak a signal as possible and adjust trimmers C4 and C6 for maximum output Turn the dial to 600 Kc. and check the alignment of the R.F. antenna and preselector stages with a tuning wand, spreading turns on the coil where less inductance is needed and pushing turns together if more inductance is required. Readjust the trimmer condenser C4 and C6 for maximum at 1,400 Kc. Turn the dial to 950 Kc. and check the alignment of the R.F. and antenna stages.

POLICE BAND

Set the wave band switch to the police "B" band position and turn the dial to 3.7 megacycles. Tune in a signal from the generator by adjusting trimmer C2, then turn the dial to 1.8 megacycles and tune in a signal from the generator by adjusting the padder C10. Check the alignment at 2.5 megacycles and if off, either push together or spread turns on the oscillator secondary as described under "Broadcast Band Alignment". Readjust trimmer C2 and padder C10 until correctly aligned. Tune in a signal at 3.7 megacycles and adjust trimmers C5 and C7 to maximum output. Now check the alignment on 1.8 megacycles with a tuning wand and make any necessary corrections by pushing or spreading turns on the coils and readjusting trimmers C5 and C7. Re check the alignment at 2.5 megacycles.

FOREIGN S.W. C (SW 1)

Set the wave band switch to the "C" position and tune in a signal at **9 megacycles** by adjusting trimmer condenser C9. Turn the dial to 5 megacycles and if necessary to correct the calibration do so by spreading or pushing turns on the coil and readjusting the trimmer condenser C9. Check the calibration at 6.0 megacycles.

With the oscillator calibrated, tune in a signal at 9 megacycles and adjust trimmer condensers C12 and C14 for maximum output. Check the alignment at 5 and 9 megacycles and make any necessary corrections by pushing or spreading turns on the coils and readjusting trimmers C12 and C14.

FOREIGN S.W. -D- (SW 2)

Set the wave band switch to "D" position and tune in a signal at 20 megacycles by adjusting trimmers C8. Check and if necessary correct the calibration at 12 megacycles by pushing or spreading the turns on the oscillator coil. Check the calibration at 15 megacycles.

With the oscillator correctly aligned tune in a signal at 20 megacycles and adjust trimmers C1 and C13 for maximum output. Check the alignment at 12 and 15 megacycles and make necessary corrections by pushing or spreading turns on the coils. Now, re adjust trimmers C11 and C13.

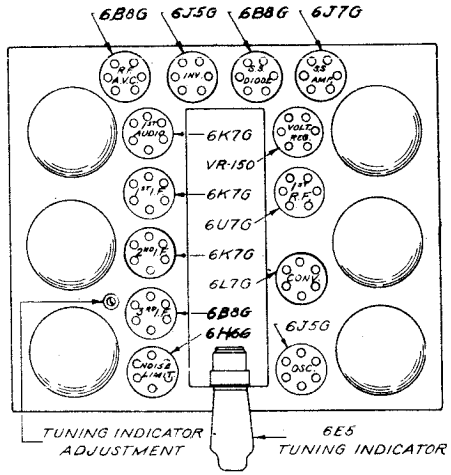
FOREIGN S.W. D- (SW 2)

ULTRA SHORT WAVE AND TELEVISION BAND

Set the wave band switch to "P" position and tune in a signal at 48 megacycles by adjusting trimmers C15 Check and if necessary correct the calibration at 32 megacycles by pushing or spreading the turns on the oscillator coil. Check the calibration at 32 and 48 megacycles.

With the oscillator correctly aligned tune in a signal at 32 and 48 megacycles and adjust trimmers C16 and C17 for maximum output. Check the alignment at 32 and 48 megacycles and make necessary corrections by pushing or spreading turns on the coils. Now, readjust trimmers C16 and C17.

The trimmer is used at the high frequency side of the band at 48 megacycles. The coil is pushed or spread for 32 megacycles for the low frequency side of the band.



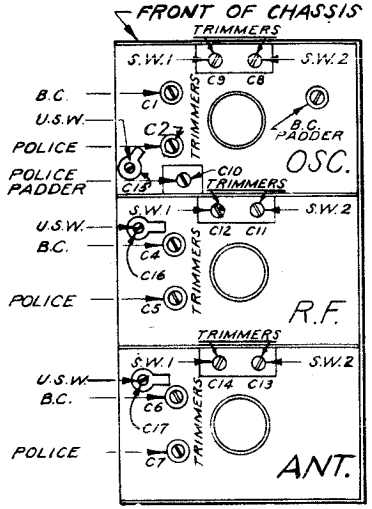


Fig. 1 TUBE LOCATIONS

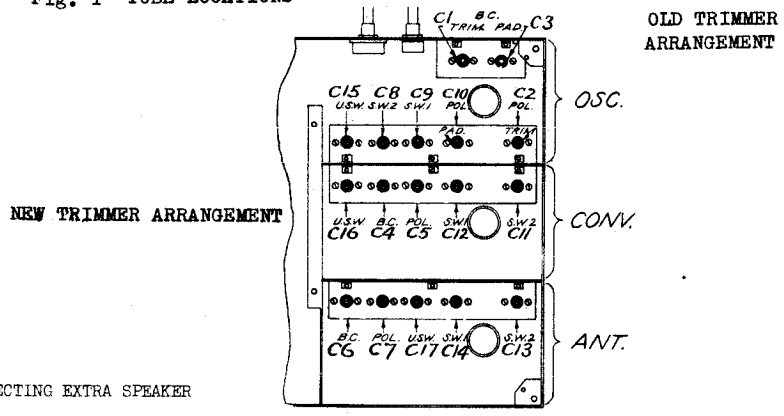

CONNECTING EXTRA SPEAKER

The new type high fidelity Scott permanent magnet 38 ohm voice coil speaker maybe readily connected to a Scott Receiver with the optional "T" pad inserted in the voice coil leads where separate control of the extension speaker volume is desired. In case the extension speaker is disconnected the jumper **might** be changed to connect terminals "V.C" and "38" together.

WAVE CHANGE SWITCH TROUBLE

Poor contact in the wave change switch can generally be corrected by slightly bending the contacts involved. However, in case a switch section is accidentally damaged beyond repair, this section can be replaced by removing the two screws which support the wave change detent plate and very carefully pulling out the wave change switch shaft. The damaged section can then be unsoldered, removed, and replaced with a new unit which should be obtained from the Scott Laboratories in Chicago before the change is made in order to assure exact duplication of switch position and connections. Note particularly that the small notch near the center of the switch rotor must be in the same position in each switch section.

Adjustment of Beat Frequency Oscillator

You will find on the back of the chassis at the right hand end looking at it from the rear, a small hole thru which can be seen a hexagon shaped nut. See Fig. 22. This can be adjusted either with a screw driver or a No. 6 spintite wrench.

To adjust, tune in a short wave station, then press in the small black button on the front of the panel just below the Wave Change Switch, and hold it in this position. Now adjust the small nut in the rear of the chassis by turning to the right or left until a whistle is heard with the station to which you have the receiver tuned. After you hear the whistle turn the nut slightly first one way then the other until the pitch of the note suits your ear.

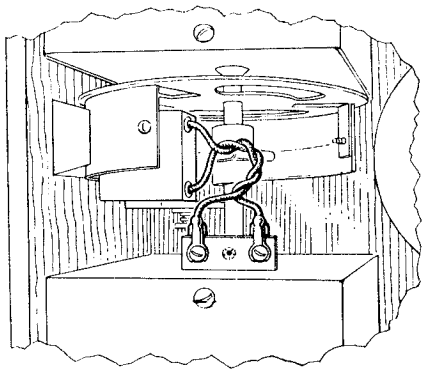

Fig. 19

How to Change Visual Tuning Meter

If the visual tuning meter stops indicating on the face of dial, lightly tap the top of meter noting if the needle releases and comes into view. If it does not, or if needle simply stays in one position on dial and does not move when tuning in stations, follow instructions given on Page 14, under heading "Tuning Meter Sticks Or Indicator Fails To Show On Dial." If these instructions have been followed with no result, the tuning meter is possibly defective.

Figure 19 shows tuning meter connected to terminal block on end of small shield can. Disconnect meter wires by loosening the two screws holding the lugs on the wires leading to meter. Now connect a short piece of wire between the two screws, as shown in Fig. 19. This will remove the visual tuner from the circuit and receiver can now be operated. *Leave tuning meter in place* and advise us at once, and a new tuning meter will be sent to replace the defective one. To remove the old meter, loosen screw holding tuning meter bracket to base of chassis, then it can be lifted out.

To install new meter, first fasten tuning meter bracket to base, making sure that it is centrally located in front of the dial strip, then replace dial light.

The connecting wire should now be removed and the two lugs on wires from tuning meter should be fastened to the terminal strip, making sure that red wire is connected to the red wire leading up from chassis, and black wire to the black wire.

Switch on receiver and with no signal tuned in, the shadow from the needle should just appear on white side of dial. If needle does not show, slide tuning meter bracket over until needle shows. Be careful not to push it over so far that it hits dial.

Final adjustment can be made by moving dial light to left or right in rubber socket.

How to Change Fuse in Power Amplifier

Your receiver is protected from serious damage by a 4 amp. automobile type fuse which is located under the base of the amplifier. This fuse should last indefinitely. However, if the fuse should burn out and the tubes refuse to light, the trouble will probably be due to a defective 5Z3 tube. In this case, of course, it will be necessary to put a new 5Z3 tube and a new fuse in your receiver and it will then be ready to operate again.

If your fuse should burn out from any other reason it will undoubtedly be due to one of the other tubes being defective or short circuited, a defective filter or bypass condenser or a broken wire or short circuit in some part of the set. In a case like this the condensers should all be checked for short circuits. After this any other trouble will be found by inspecting the wiring of the receiver.

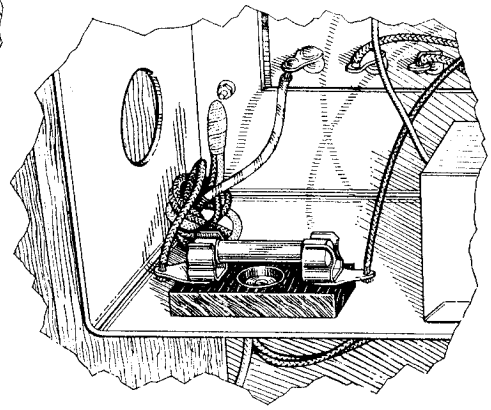

Fig. 20. Fuse Block Located Under Amplifier.

Do not, on any account, replace this fuse with a solid connection such as a piece of tin foil or the various expedients tried by amateur electricians to get things going again, for if you do, serious damage will be caused and if repairs are necessary you will be charged for them under these circumstances. If you do not have a spare fuse exactly like the one supplied, then you can temporarily use one of 3 amps. but we will be glad if you will write us immediately, to send you some additional fuses, free of charge.

How to Change Dial Light

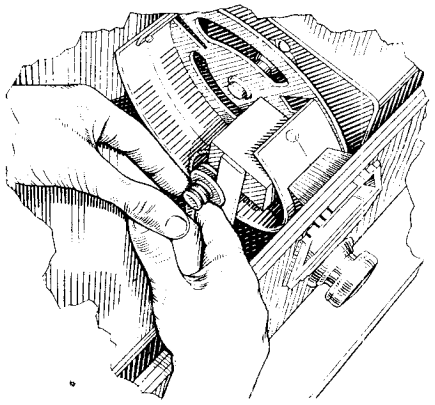

Fig. 21. Changing Dial Light.

When changing the dial light, first turn the tuning dial to meg-kil, slip dial light socket and rubber bushing out of notch in tuning meter bracket. See Fig. 21.

NOTE: When removing the dial light you first slip down the spring clip that holds it in place. The clip is used principally to keep dial light in place during shipment, and need not be replaced, as rubber socket has sufficient grip.

Bring the dial light socket under the shaft of the tuning condenser and up in back of the shaft. The dial light bulb can then be easily screwed out of the socket and another replaced. The entire socket assembly can then be placed back under the tuning condenser shaft and slipped back into place.

After changing the dial light the pointer of the visual tuning meter may be too far to the right so that it cannot be seen unless a station is tuned in. In this case, the dial light socket should be slipped back and forth in the rubber bushing until the shadow of the tuning meter just shows on the right hand side of the dial when no station is tuned in.

Phonograph Pick-Up

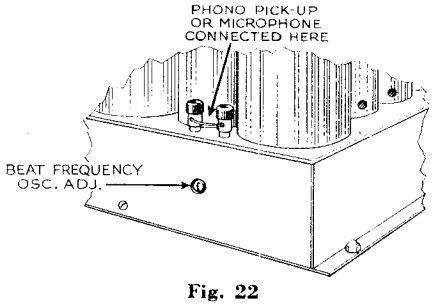

Fig. 22

The SCOTT ALLWAVE FIFTEEN RECEIVER is equipped with two binding posts on the rear of the chassis located on the right end, looking at the chassis from the rear. See Fig. 22. When shipped these two posts are connected together with a short piece of wire. When it is desired to hook up the receiver to a phonograph, remove this wire and connect the two wires from the phonograph pick-up

Section IV CIRCUIT DESCRIPTION

4.1 General

The schematic diagram of the receiver chassis is shown in Figures 25 and 26 and the schematic diagram of the power supply chassis is shown in Figures 27 and 28. For purposes of illustration it will be assumed that the circuits are set up for reception on the Broadcast (BC) Band for AM reception.

4.2 AM-RF and Mixer Circuits

Signal input to the receiver through AM antenna connector strip E1 is connected to the primary winding of BC band antenna primary coil L1 through switch SW2A. An electrostatic shield, at ground potential, separates the secondary winding from the primary. The secondary coil L2, together with variable air capacitor C5A1 constitutes the first tuned circuit. Transfer of RF signal at the resonant frequency of this tuned circuit, from the antenna to the control grid of RF amplifier tube V1, is accomplished by inductive coupling through the antenna transformer L1, L2. Variable capacitor C5 is a three unit capacitor, each unit being split into two sections. The larger sections C5A1, C5B1 and C5C1 being used for tuning the AM-RF and oscillator circuits and the small sections C5A2, C5B2 and C5C2 being used for tuning the FM-RF and oscillator circuits. The secondary winding L2 is provided with an adjustable powdered iron core E3 for inductance trimming and a shunt connected variable capacity trimmer C1. These trimmers allow accurate alignment of the tuned circuit at both ends of the frequency band and are accessible for adjustment at the bottom of the receiver as shown in Figure 14. The high potential end of the tuned circuit is connected to the control grid of RF amplifier tube V1 through switch SW2A, switch SW1 and through coupling capacitor C3. The low potential end of the circuit is returned to chassis ground. The DC bias return from the control grid of RF amplifier tube V1 to the AVC line is closed through resistor R1. Switch SW1 located at the rear of the receiver chassis is provided so that a loop antenna, connected through loop receptacle J7, may be used in place of an outside antenna as outlined under Antenna Requirements, Paragraph 1.5.

Plate potential from the high voltage DC line is applied to the plate of RF amplifier tube V1 through filter resistor R11, bypassed to ground by capacitor C18A. One section of switch SW3A is used to cut off DC voltage from the plate and screen of RF amplifier tube V1 and the screen of mixer tube V3 when the Selectivity control is set at PHONO or TELEVISION positions in order to keep any RF signal from leaking through when using the audio amplifier of the receiver for record player reproduction or television sound broadcasts.

Screen potential is applied to RF amplifier tube V1 through filter resistor R4 bypassed to ground by capacitor C4B. Resistor R3 is connected from screen to ground to provide more stable screen potential with fluctuations in AVC voltage, this providing better AVC characteristics on strong signals. The suppressor of V1 is connected to ground. Initial grid bias is obtained by means of cathode resistor R2 bypassed by capacitor C4A. Grid bias on V1 can be increased when full sensitivity is not required, by means of Sensitivity control R5 which also controls the bias on first IF amplifier tube V4. One side of the heater circuit of V1 is grounded at the socket.

The amplified signal from the plate of RF amplifier tube V1, is transferred to the signal grid of mixer tube V3 through RF transformer L7. The primary of L7 is untuned. The secondary winding together with variable capacitor C5C1 constitutes the second and final tuned circuit operating at signal frequency. The high potential end of the tuned circuit is connected to the signal grid of mixer tube V3 by switch SW2C, through coupling capacitor C17. The low potential end of the tuned circuit connects to ground. Adjustable iron core E7 and parallel connected trimmer capacitor C15 are provided for circuit alignment. The DC bias return from the control grid of mixer tube V3 to the AVC line is closed through resistor R8. Screen potential from the high voltage DC line is applied through resistor R12 bypassed to ground by capacitor C18B. The suppressor is internally connected to the shell of the tube. Initial bias is obtained by cathode resistor R10 bypassed by C18C.

4.3 AM-Oscillator Circuit

The AM-oscillator circuit is of the electron coupled type. The tuned circuit consists of tapped inductor L5 shunted with variable trimmer capacitor C6 and is tuned by variable capacitor C5B1 which is shunted by fixed capacitor C13 provided to increase the fixed minimum capacity of the circuit. The inductor L5 is provided with a variable iron core for inductance adjustment. Fixed capacitor C7 shunted by variable padder capacitor C8 is provided to modify the tuning of the oscillator circuit so that it will maintain a fixed frequency difference of 455 kilocycles with respect to the signal frequency circuits when the main tuning capacitor C5A1, C5B1 and C5C1 are varied from minimum to maximum capacity. On both the BC and SW-AM bands the oscillator frequency is maintained 455 kilocycles higher in frequency than the signal frequency.

The high potential end of the tuned circuit is connected to the control grid of AM oscillator tube V2, through switch SW6B mounted on the FM-AM relay K1, and through switch SW2B and fixed capacity C11. The low potential end of the coil returns to ground. The grid of V2 is returned to ground through resistor R6. The cathode of V2 is connected to the tap on inductor L5 through switch SW2B and through capacitor C14 to oscillator injector grid (Pin #5) of mixer tube V3. This grid is returned to ground through resistor R9. The plate of the oscillator tube V2 is connected to the 150 volt regulated high voltage DC line through resistor R7, bypassed by capacitor C12, and through switch SW6A on the FM-AM relay K1. This switch removes voltage from the plate of oscillator tube V2 when the receiver is adjusted for FM reception. One side of the heater of V2 is grounded at the socket.

4.4 AM-IF Amplifier Circuits - 455 Kilocycles

The signal frequency arriving at the control grid of mixer tube V3 and the oscillator frequency fed to the injector grid of this tube or mixed (or heterodyned) and the resultant difference frequency (455 kilocycles) is fed to the input of the IF amplifier.

Transfer of IF signal from the plate of the mixer tube V3 to second detector tube V9 is accomplished by inductive coupling through IF transformers T1, T2 and T3 and amplified by tube V4 and V5. The first IF transformer T1 consists of two tuned circuits, primary and secondary with the secondary circuit operating in conjunction with switch SW3A and a tapped tertiary winding to provide three degrees of selectivity by changing the co-efficient of coupling with the primary circuit. The primary and secondary windings are each tuned to 455 kilocycles by fixed capacitors C20 and C21 and adjustable iron cores E9 and E10. These iron cores are accessible for adjustment through the top of the shield can for E10 and at the bottom of the receiver for E9. The high potential end of the primary tuned circuit connects to the plate of mixer tube V3 through a shielded conductor while the low potential end connects to the high voltage DC line through resistor R13 bypassed to ground by C19. The high potential end of the secondary tuned circuit is connected to the grid of first IF amplifier tube V4 while the low potential end is connected to the AVC line through switch SW3A and resistor R16, bypassed to ground by C22. DC potential from the high voltage DC line is applied to the screen of V4 through resistor R18 bypassed to ground by C23B. Plate potential is applied through the primary tuned circuit of second IF transformer T2 and through resistor R19 bypassed to ground by C23C. Initial grid bias is obtained through resistor R17, bypassed to ground by capacitor C23A. Resistor R17 is returned to ground through sensitivity control R5 so that the bias on V4 may be increased when maximum sensitivity is not desired.

Second IF transformer T2 is similar to first IF transformer T1 in respect to design, construction and operating characteristics. Therefore except for differences in symbol designations the circuit description of first IF transformer T1 is applicable to this transformer. The low potential end of the secondary tuned circuit of T1 is returned to ground through switch SW3B. Grid bias for second IF amplifier tube V5 is obtained through resistor R22, bypassed to ground by C26A. Screen potential is applied through resistor R23, bypassed by C26B. Plate potential is applied through the primary winding of third IF transformer T3 and resistor R24, bypassed to ground by C26C.

Third IF transformer T3 consists of a tuned primary circuit and an untuned secondary. The primary circuit consists of the primary winding shunted by fixed capacitor C27 and adjustable iron core E13 which is accessible for adjustment at the bottom of the receiver. The high potential end of the secondary winding feeds the second detector diode, while the low potential end returns to ground through diode load resistors R31 and R32.

4.5 AM Second Detector Circuits

The second detector tube V6 is a twin diode tube, one section being used as a second detector diode the plate of which is connected to the high potential end of the secondary winding of T3. The cathode is connected to ground, thus the tube acts as a half wave rectifier. The voltage developed across diode load resistors R31 and R32 is filtered by resistor R34 and capacitor C29B to remove all audio components, and the resultant direct current AVC voltage is used to control the gain of amplifier tube V1, V3 and V4; the degree of control being dependent on the strength of the incoming signal.

The second section of the twin diode tube V6 is utilized as a peak noise limiter which is effective only on the AM shortwave band where interference from ignition or similar peak noise may be encountered. The audio voltage appearing at the junction of R31 and R32 as a result of the demodulating action of the second detector diode, is normally coupled to the input of the audio amplifier. When the Sensitivity control is advanced to maximum rotation, switch SW4 connects the audio input to the cathode of V6 and the noise limiter circuit is in operation.

DC potential from the AVC line is further filtered by resistor R35 and capacitor C29C and applied to the control grid of tuning eye tube V7-6E5. This DC voltage regulates the shadow angle of the tube to indicate when the receiver is tuned to resonance with the received signal.

4.6 Audio Amplifier Circuits

The 1st and 2nd audio amplifier circuits are located on the receiver chassis while the phase inverter and output amplifier are on the power supply chassis. The audio voltage developed across the diode load resistors R31 and R32 is applied to the control grid of first AF amplifier tube V9-6J5, through capacitor C30 and volume control R37.

Switch section SW6A on the FM-AM relay actuates to connect the output of either the AM detector or the FM discriminator to the audio input switch section SW3C. This switch connects the input circuit of 1st audio amplifier V9-6J5 to radio input. Phono input or television sound input, depending on the setting of the Selectivity control.

Initial bias for 1st audio amplifier V9-6J5 is obtained through resistor R38 bypassed by C31. Plate potential is applied through filter resistor R40, bypassed by 1 section of dual capacitor C33, and through load resistor R39.

Audio signal from the plate of V9 is fed through capacitor C32 to the grid of 2nd audio amplifier tube V10-6J5. The grid of V10 is returned to ground through resistor R41 and R47. Initial bias is obtained through resistor R42 bypassed by C34. Plate potential is applied through filter resistor R44, bypassed by the second section of C33; and through load resistor R43.

Signal from the plate of V10 is coupled to the grid of 3rd audio amplifier tube V19-6SL7GT, located on the power supply chassis, through capacitor C35, to terminal #3 of audio plug P2, through terminal 3 of audio receptacle J4 and through audio compensating network R80, C87.

The tone control circuit consisting of treble control R45 and associated capacitor C36; bass control R46 and associated audio choke L14, and capacitor C37. Both R45 and R46 are centertapped controls and when the controls are both set at the position of the tap the audio response curve is flat. By tuning the treble control clockwise the high frequency response is boosted and when turned counterclockwise the high frequency response is cut. When the bass control is turned clockwise the low frequency response is boosted and when turned counter clockwise it is cut; thus the frequency response of the audio amplifier can be controlled over a wide range.

The grid of 3rd audio amplifier V19A which is one section of a dual triode tube 6SL7GT, is returned to ground through R81. Capacitor C97 is used in conjunction with audio compensating network R80, C87 which is provided to compensate for loss of high frequency response in the long connecting lead from the plate of V10 to the grid of V19A. Initial bias for both sections of V19 is obtained through resistor R82 bypassed by capacitor C88. Plate potential is applied to V19A through R84 and to V19B through R83.

Audio signal from the plate of V19A is fed to the grid of audio output amplifier V20, through capacitor C89; this grid is returned to ground through R85 and R87.

Audio signal from the plate of V19B is fed to the grid of audio output amplifier V21 through capacitor C90; this grid is returned to ground through R86 and R87.

Audio voltage appearing at the junction of resistors R85, R86 and R87 is fed to the grid of V19B. Since this voltage is 180 degrees out of phase with that appearing at the grid of V19A the audio voltages appearing at the plates of V19A and V19B will be 180 degrees out of phase, thus providing push pull amplification.

Initial grid bias for V20 and V21 is obtained through resistor R88 bypassed by C91. Screen potential for V20 and V21 is applied direct from the power supply. Plate potential is applied through the centertapped primary of output transformer T8. Capacitor C92 and resistor R90 are connected in series across the plates of V20 and V21 to prevent parasitic oscillation in the output amplifier circuit.

4.7 FM-RF Oscillator and Mixer Circuits

The FM-RF amplifier, mixer and oscillator circuits are located on the receiver chassis, the FM-IF amplifier and discriminator circuits are located on the power supply chassis. Input signal from the antenna is fed through FM-antenna terminal strip E2, located at the rear of the receiver, through antenna coil L9 to the grid of FM-RF amplifier V11-6AG5 which is a miniature type tube. The secondary of antenna coil L9 is connected to the grid of V11 through a parasitic suppressor R26, the low potential end of the coil being grounded. It is tuned by variable air capacitor C5-A2. Variable trimmer capacitor C39 and adjustable iron core E14 are provided as trimmer adjustments. Shunt connected capacitor C38 is provided to increase the minimum capacity of the tuned circuit. Initial grid bias is obtained through R48 bypassed by C40. Screen potential is applied through resistor R49 bypassed by C41. Plate potential is applied through the primary of mixer coil L11 and resistor R51 which is bypassed by C47.

Signal from the plate of V11 is fed to the grid of FM-mixer tube V13-6AG5, through mixer coil L11 and parasitic suppressor R53. The secondary tuned circuit of L11 is tuned by variable air capacitor C5 and C2. Air trimmer C49 and adjustable iron core E16 are provided as trimmer adjustments while fixed capacitor C48 is provided to increase the minimum capacity of the tuned circuit. Initial bias for V13 is obtained through R54 bypassed by C45. This circuit is returned to ground through a small portion of the secondary winding of FM oscillator coil L10. This impressing a voltage on the cathode of V13 at the frequency to which the oscillator circuit is tuned. This signal which is always 10.7 megacycles lower in frequency than the signal frequency, is heterodyned or mixed with the signal frequency appearing on the grid of mixer tube V13 and the resultant frequency 10.7 megacycles appears at the plate of FM mixer tube V13.

Screen potential is applied to V13 through R55 bypassed by C51. Plate potential is applied through IF primary coil L12 and resistor R56 bypassed by C53. One side of the heater of V13 is bypassed to ground by C50.

FM oscillator tube V12-6C4 is a miniature type triode. The tuned circuit consists of FM oscillator coil L10 and variable air capacitor C5B2; variable trimmer capacitor C43 and adjustable iron core E15 are provided as trimmer adjustments. Fixed capacitor C42 is provided to increase the minimum capacity of the tuned circuit. The high potential end of L10 connects to the grid of V12 through coupling capacitor C44. The grid is returned to ground through R50. The cathode of V12 is connected to a tap on coil L10. Plate potential is applied through R52 bypassed by C46.

4.8 FM-IF Circuits

The IF signal appearing at the plate of FM mixer tube V12 is fed to the primary of 1st FM-IF transformer L12. This coil is tuned to 10.7 megacycles by capacitor C52 and adjustable iron core E17. The primary winding is then link coupled to the secondary winding, located on the power supply chassis, through FM-IF input plug P3 and jack J5 and through another small winding coupled to the secondary coil L13. The 1st FM-IF secondary coil L13 is tuned to 10.7 megacycles by capacitor C54 and adjustable iron core E20 and is connected to the grid of 1st FM-IF amplifier V14-6AC7 through parasitic suppressor R57.

Bias is obtained through R58, bypassed by C55. Screen potential is applied through R59 bypassed by C57. Plate potential is applied through the primary winding of 2nd FM-IF transformer T4 and resistor R60 bypassed by C58. One side of the heater of V14 is bypassed to ground by C56.

The primary of T4 is tuned to 10.7 megacycles by capacitor C59 and adjustable iron core E21. The primary is inductively coupled to the secondary which is tuned by capacitor C60 and iron core E22. The high potential end of the secondary connects to grid of 2nd FM-IF amplifier V15-6AC7 through capacitor C61 and parasitic suppressor R62. The low potential end returns to ground. The grid of V15 returns to ground through R61. Through the use of coupling capacitor C61 and grid leak R61 second FM-IF amplifier tube V15 will act as a limiter on extremely strong signals.

Second FM-IF amplifier V15-6AC7 is identical to first FM-IF amplifier tube; therefore except for symbol designations the circuit description is the same.

Third and fourth FM-IF transformer T5 and T6 are similar to second FM-IF transformer T4 and except for symbol designations the circuit description is the same.

©John F. Rider

©John F. Rider

The third and fourth FM-IF tubes are used as limiter amplifiers. By employing the proper plate and screen voltages and correct values of grid leak and coupling capacitors these tubes will reach full limiting action with approximately 10 microvolts input signal, effectively shunting any amplitude signals such as ignition noise or impulse interference signals. The values of grid leak and coupling capacitor used were chosen to insure fast limiting action on noises possessing a steep wave front.

4.9 FM Discriminator Circuit

The fifth FM-IF transformer or discriminator transformer is provided to couple the second limiter tube V17 to the discriminator diode V18. A phase bridge type of discriminator circuit is used with both primary and secondary circuits being tuned by air dielectric trimmers C80 and C82. The primary and secondary windings are inductively coupled so that the peaks of the discriminator are approximately 300 kilocycles apart. The discriminator is linear up to plus or minus 100 kilocycles from the IF frequency of 10.7 megacycles, in order that over-modulation beyond plus or minus 75 KC at the transmitter will not cause distortion in the receiver.

The balanced detector action of the discriminator tube diode acts to cancel any amplitude modulation present on weak signals. Signal voltage appearing across the primary of T7 is induced into the secondary of this transformer which reacts with the voltage coupled from the primary through capacitor C81 to produce frequency discriminating action. When the frequency of the signal flowing through T7 is exactly 10.7 megacycles the voltage across resistors R77 and R78 are equal and opposite. A change in the frequency in one direction produces a positive difference between the voltages across R77 and R78; a frequency change in the opposite direction produces a negative voltage difference. In this way frequency modulation of the carrier signal produces a similar audio frequency voltage across resistors R77 and R78. This audio voltage is fed to the audio amplifier input through a de-emphasis network consisting of resistor R7 and capacitor C85. RF choke L16 and capacitor C86 are provided to filter out any RF components which may be picked up in the audio input lead.

4.10 Rectifier Power Supply Circuits

The rectifier power supply of the Model 800-B Radio-Phonograph is designed to operate from a 115-120 volt 50-60 cycle AC source. The power supply chassis is provided with a 6 foot two conductor cord with plug for connection to the AC source.

One side of the primary circuit of power transformer T9 is fused with a 3 amp fuse and one side of the primary circuit of the pushbutton tuning transformer T10 is fused with a 1 amp fuse. The primary of T10 is connected across the AC line at all times so that voltage is always available to operate the AC-ON-OFF relay.

The primary circuit of the power transformer T9 is closed when the power ON-OFF relay K2 is thrown to the ON position by pushing the ON button at the front panel. One side of this primary circuit connects to terminal 10 of speaker receptacle J2. When the speaker plug P4 is inserted into the receptacle, the jumper wire between terminals 9 and 10 of the speaker plug completes the AC circuit to terminal 1 of the receiver receptacle J3 through the switch on relay K2 then back through terminal 4 of receiver receptacle J3 to the power transformer. The AC power circuit is fed through the speaker receptacle J2 so that if the speaker plug is removed when the power is on, the primary circuit is automatically broken and no damage can be done to the high voltage rectifiers. Capacitor C96 is provided to filter out any noise entering through the primary circuit of the power transformer. Receptacle J1 is provided for connection of the AC plug on the record changer. This receptacle is connected across the primary circuit of the power transformer and is active only when the receiver is turned ON.

One secondary of the power transformer furnishes high voltage for the full wave rectifier plates. Another winding furnishes filament voltage for the rectifier tubes V23 and V24. A third winding furnishes heater voltage for all tubes in the power supply chassis except the rectifiers. A fourth winding furnishes heater voltage for all tubes on the receiver chassis.

The rectified voltage from the rectifier tubes V23 and V24 is filtered by a two section filter and fed to the plate of the power output tubes V20 and V21 through the primary of output transformer T8. This voltage is also fed through terminal 2 of speaker receptacle J2 and plug P4 to the 675 ohm field of the loudspeaker; from the field it feeds back through the speaker plug and receptacle terminal 4 and fed to the plates of V19A and V19B and the screens of V20 and V21. From this point a dropping resistor R92 reduces the voltage to the proper potential for all other tubes in the receiver.

The voltage regulator tube V22-OD3 (VR-150) is included in the power supply circuit to provide stabalized voltage for the AM and FM oscillator tubes so that variations in line voltage will not affect the frequency setting of the oscillator circuits.

4.11 Loudspeaker Circuits

The loudspeaker used with the Model 800-B Radio-Phonograph may be either a coaxial type or an extended range single speaker. Both speakers have the same field characteristics. A 675 ohm series field connected to terminals 2 and 4 of speaker plug P4 and a 9000 ohm shunt field connected to terminals 4 and 6. The coaxial speaker consists of a 15 inch low frequency speaker with a 5 inch FM tweeter mounted in the center. A network is used with the high frequency tweeter so that it will reproduce only the higher frequencies. The voice coil impedance of the coaxial speaker is 8 ohms and is connected to terminals 3 and 5 of speaker plug P4. One side of the tweeter circuit is connected to terminals 7 and 8 of the speaker plug which feed through the speaker receptacle J2 to terminals 8 and 11 of the receiver power receptacle J3; then through the cable to switch SW6A on the FM-AM relay. When the switch is thrown to FM position this circuit is closed and the tweeter is effective but when the relay is thrown to AM position the tweeter circuit is open and only the 15 inch low frequency is effective. Since the low frequency speaker will reproduce all frequencies desired for AM broadcasts or record reproduction the tweeter is not used to prevent reproduction of undesirable back ground noise. The 15 inch extended range single speaker has a voice coil impedance of 16 ohms and is connected to terminals 1 and 5 of speaker plug P4, since no tweeter is used, terminals 7 and 8 are open.

4.12 Pushbutton Tuning System Circuits

The pushbutton tuning system in the Model 800-B Radio-Phonograph utilizes 14 pushbuttons, 12 of which are used for station selection and 2 being used to turn the receiver ON and OFF. Figures 29 and 30 depict the circuit diagrams of the systems used in the early models and the present models. The switches used are all single pole single throw, momentary contact pushbutton type. Seven switches are used in each gang located at the right and left side of the panel. Details on setting up and adjusting the pushbutton system are explained in Section V - Adjustments.

Each of the twelve pushbutton switches is connected by a color-coded lead to a terminal board E27 mounted on the under side of the receiver chassis. This terminal board is used as a common tie-point for wires leading to the switches, the backplate contacts and the remote box receptacle.

The backplate is the nerve center of the pushbutton tuning system. It consists of two semi-circular disks insulated from each other by a bakelite strip which has a narrow protrusion rising above the contact surfaces of the disks. The two disks are connected to the two windings of a reversible type motor which is coupled directly to the tuning shaft of the dial. The two disks which form the backplate rotor are coupled directly to the shaft of the main tuning capacitor. On the stator of the backplate are mounted twelve contact fingers with numbered, adjustable knobs. Each of these contacts are connected to a switch on the front panel as shown in Figure 9. On the early Model 800-B Receiver the backplate operates as follows, taking contact No.1 as an example. When pushbutton No. 1 is pushed the switch contacts close and potential from the 36 volt tap of pushbutton tuning transformer T10 is fed through the coil of muting relay K3 to terminal 3 of receiver power receptacle J3, then through receiver plug P1, terminal 3 to switch SW5 on the power ON-OFF relay, then to switch section SW2D of the band change control, to switch section SW3D of the selectivity control, then through lead No. 1 to the common terminal of the tuning motor. The voltage could then flow through either winding of the motor but since contact No. 1 is on the left side of the backplate rotor the voltage will be applied only to that side of the rotor through contact No. 1 to switch No. 1 then through lead No.5 and through coil L18 of the FM-AM relay to chassis ground. It is then returned to the other side of the 36 volt winding of the transformer through chassis ground. When the circuit is energized by closing a pushbutton switch as above the voltage across the coil L22 of muting relay K3 will energize the relay, closing the contacts and muting the audio circuit so that signals are not audible as the dial tunes across them. The voltage flowing through the motor winding causes it to rotate, actuating the dial mechanism and turning the backplate rotor, until the insulated segment rides under the active contact, at this instant the voltage in the circuit is interrupted and the motor stops running releasing the contacts on the muting relay. Since pushbutton No. 1 is connected to the AM common lead, the AM coil of the FM-AM relay would be energized when the circuit was closed thereby switching the AM circuits ON and making the FM circuits ineffective. If pushbutton switches 5, 6 or 7 or any switch which may be connected to the FM common lead were energized, the relay would automatically switch over as the FM coil of the relay would then be energized.

Figure 30 depicts the pushbutton tuning system used in the later model 800-B Receivers. The pushbutton switches are provided with two rows of dummy lugs, one row connected to the AM common lead, the other row connected to the FM common lead, and all that is necessary to use any pushbutton for FM or AM is to connect that switch to the corresponding common lead. It will be observed that the numbers opposite the pushbuttons have been rearranged so that they are in sequence - 1 to 12. Pushbuttons 5, 6 and 7 are still wired for FM when the receivers leave the factory as most of the FM stations are located in the center of the tuning scale but in locations where a frequency at some other part of the dial has been allocated, another pushbutton may be used by disconnecting the jumper wire of that particular switch from the AM common lead and connecting it to the FM common lead. The next item to be observed is the addition of two relays in series with the backplate rotor disk. When either of these relays are energized by voltage applied through the rotor disk, switches SW10 or SW11 are closed completing the motor circuit and turning the dial mechanism. By means of this arrangement very little current is required to pass through the backplate movable contacts thus prolonging their life. It will be noted also that the 36 volt tap of the pushbutton tuning transformer T10 is no longer required, all necessary potential being supplied from the 24 volt tap.

The pushbutton system drive motor is a 24 volt reversible type motor geared directly to the dial drive mechanism.

The power ON-OFF relay is a double solenoid relay with 1 rotary type switch section. When one of the solenoid coils is energized by pushing the ON pushbutton the relay actuates the switch to close the AC primary circuit of the power transformer and also closes the 24 volt circuit to the drive motor. When the other solenoid coil is energized by closing the OFF pushbutton, both of the above circuits are opened. Both solenoid coils operate at 24 volts AC.

The FM-AM relay is a double solenoid relay with 2 rotary type switch sections that operate 6 circuits. When one coil is energized by closing any AM pushbutton switch all circuits close to operate for AM reception, when the other solenoid coil is energized by closing any FM pushbutton switch, the circuits close to operate for FM reception. Both solenoid coils operate at 10 volts AC on the early model receivers and on all late model receivers with the relays in the drive motor circuit. The solenoid coils of the FM-AM relay operate at 22 volts AC.

The muting relay used in the 800-B Receiver is actuated by the voltage used to run the drive motor. The switch is a S.P.S.T. with contacts normally open. The coil operates on 2.4 volts AC.

The drive motor relays are identical in electrical characteristics to the muting relay although in some receivers the mechanical construction will be different.

The remote keyboard receptacle J6 is a 21 contact receptacle provided for the connection of a remote keyboard when it is desired to tune the receiver from a remote position. By means of this remote keyboard it is possible to tune in up to 12 stations, control the volume and turn the receiver ON and OFF. When the remote keyboard is to be used, a motorized volume control with the necessary connections is installed in the 800-B Receiver.

Section V ADJUSTMENTS

5.1 Setting up Pushbutton Tuning System

The pushbutton tuning system in the 800-B Receiver has been designed to provide maximum flexibility in order to permit setting up for 6 or more AM stations and 1 to 6 FM stations, the only limitations being the spacing of the stations on the tuning dial or the setting for an AM station falling on the same spot as that for an FM station. At the factory the receivers are wired so that 4 buttons on the left side of the panel and the 5 top buttons on the right side are wired for AM stations and the lower button on the right side with the two top buttons on the left side are wired for FM stations as shown in Figure 9. No attempt should be made to set up the pushbutton tuning system for weak distant stations as poor results will be obtained because of background noise.

The switch over from AM to FM reception is done automatically in the receiver, that is, with the receiver adjusted for pushbutton tuning, when any AM button is pushed the receiver is automatically set for AM reception and when any FM button is pushed the receiver is automatically switched for FM reception.

The pushbutton tuning drive unit is located at the rear of the receiver chassis. This unit has 12 adjustable knobs which are numbered 1 to 12. These knobs are set to the desired position by turning them clockwise or counter-clockwise with a rotary motion. They are locked in position by means of a small screw, adjacent to the knob. These small lock screws should never be tightened more than one turn past the point where the screw touches the backplate. If tightened more the setting of the knob will be changed. Two calibrated scales located below the two rows of knobs, are provided to enable setting the knobs in conjunction with the logging scale at the top of the front dial scale. Each of the pushbuttons on the front panel is wired to the corresponding knob on the backplate in the sequence shown in Figure 9. The following procedure should be followed in setting up the pushbutton tuning system.

1. Set the Selectivity control to "M" position and the AM-Band control to "BC" position.

2. Select the lowest frequency AM station to be set up and insert the tab for this station in pushbutton No. 1.

3. Tune in the desired station manually and note the setting of the dial pointer on the logging scale at the top of the dial.

4. Set knob No. 1 on the backplate to the corresponding number noted on the logging scale, and lock the knob in place by means of the small screw directly above it. CAUTION: Never tighten the small locking screw more than one turn past the point where it touches the backplate; if tightened more the setting of the knob will be changed.

5. As a check to ascertain that the knob is set correctly, manually set the dial pointer to a higher frequency, then push button No. 1 until the pointer stops and check this setting against the original reading on the log scale. Repeat this operation after setting the dial to a lower frequency. If the both readings are higher or both readings lower than the original log scale reading for this station then the No. 1 knob must be moved slightly to correct for the error in reading. If the two readings are spaced equally one-half a division or less on both sides of the original station setting, as read on the log scale, the adjustment has been correctly made.

6. The above operation should be repeated for each pushbutton to be set up, starting with button No. 1 for the lowest frequency station and working up consecutively to button No. 12 for the highest frequency station. Pushbuttons 5, 6 and 7 can be used only for FM reception and when any of these buttons are pushed the receiver will automatically switch over to FM reception.

NOTE: The pushbutton tuning system will work only when the Selectivity control is set at "M" or "B" positions and the AM-Band control is set at "BC" position. If the pushbutton system does not work when the controls are set as above, replace the 1 amp fuse in the power supply. Refer to Figure 21 for location.

5.2 Connecting Pushbutton Switches for AM or FM Operation

When more than 3 FM stations or more than 9 AM stations are desired, by connecting the pushbutton switches as outlined below, any of the 12 pushbuttons may be set up for either an AM or FM station.

On the first Model 800-B Radio-Phonographs produced, the pushbutton switches were connected as shown in Figure 11. It will be noted that on the left hand switch gang, one side of switches 1-2-3-4-8-9 are all connected to the black AM common lead, therefore, all these switches will operate on AM stations. If it is desired to connect one or more of the switches on the left hand side for FM stations, it will be necessary to disconnect the switch or switches required from the black AM common lead and connect them over to the white FM common lead on the right hand switch.

On the right hand switch gang, one side of switches 5-6-7 are connected to the white FM common lead, therefore, these three switches are used to set up FM stations. One side of switches 10-11-12 are connected to the white-red dot AM common lead and are used to set up AM stations. In order to use anyone of these switches for an FM station, disconnect that switch from the AM common lead and connect it to the FM common lead. In this manner any one of the twelve pushbutton switches may be connected for operation on either AM or FM.

On the later Model 800-B Radio-Phonograph, the switch gangs have been provided with 2 dummy lugs on each section; one row of dummy lugs are connected to the AM common lead, the other row of dummy lugs are connected to the FM common lead and all that is necessary to connect any pushbutton for operation on AM, is to connect that switch to the AM common lug and for FM operation connect it to the FM lug. It will be noted by observing Figure 12 that the pushbuttons are now numbered in sequence 1 to 12 starting at the bottom pushbutton on the left side of the panel.

Table 1 Trouble Location Chart

Symptom	Cause	Remedy
Set fails to switch ON or OFF	Blown 1 amp or 3 amp fuse	Replace defective fuse
	Defective switch contacts on ON-OFF relay	Adjust contacts on switch or replace switch section
	AC ON-OFF relay inoperative	Check relay connections
		Put drop of light oil on rotor shaft bearing
Set operates but pushbutton system fails to operate	Blown 1 amp fuse	Replace defective fuse
	Defective switch contacts on ON-OFF relay	Adjust contacts on switch or replace switch section
Set weak or dead on all bands	Blown 3 amp fuse	Replace defective fuse
	Defective tube in audio amplifier or rectifier	Replace with good tube
	Defective speaker	Check continuity of voice coil
		Check continuity of field coils
		Check components and connections of network on coaxial speakers
	Socket voltages wrong	Check associated bypass capacitors
		Check associated resistors
		Check continuity of associated wiring
	Defective switch contact	Clean and adjust defective switch or replace switch section
Set weak or dead on one band only	No signal	Check all coils on specific band
		Check switch contacts on specific band
		Check all tubes used for specific band
		Check FM-AM relay

Table 1 Trouble Location Chart (Continued)

Symptom	Cause	Remedy
Noisy reception	Defective tube	Tap all tubes lightly and replace any that are noisy
	Defective component	Tap all components lightly with insulated rod. Check carefully suspected parts
	Defective antenna	Check antenna installation, lead-in and connections
Oscillation	Defective tube	Replace tubes one at a time
	Open bypass capacitor	Connect good capacitor across suspected unit temporarily Replace defective unit
Hum	Defective tube	Replace tubes one at a time
	Defective electrolytic filter capacitor	Replace defective unit
	Defective bypass capacitor	
	Transformer lamination buzz	Tighten screws on power transformer and 46 volt transformer
		Insulate 46 volt transformer from bottom cover plate with tape
		Mount power supply on rubber or felt

Section VI MAINTENANCE AND REPAIRS

Lubrication

There are very few moving parts on the Model 800-B Radio-Phonograph that will require lubrication more often than once a year with the possible exception of the record changer and this will depend on the amount of use the record changer receives. The manufacturers recommendations on lubrication as outlined in the instruction book packed with each record changer should be followed. A drop or two of #10 oil on the receiver slide rails and record changer compartment once a year will keep these parts working smoothly. In addition a drop of #10 oil should be applied to the dial tuning shaft bearing and the FM-AM relay and power ON-OFF relay bearings.

6.4 Pushbutton Tuning System Maintenance

Although there are very few moving parts in the pushbutton tuning system which will require frequent adjustment or maintenance the following information is outlined to assist in keeping the system in good working condition.

1. Pushbutton switches

A little carbon-tetrachloride, applied with a clean cloth or a small brush while the switch is worked back and forth, will keep the contacts clean.

2. Drive motor and remote volume motor

The clutch release spring on the back of these motors at the end of the rotor shaft may need adjusting to keep the clutch from chattering. A pair of long nose pliers should be used for this adjustment. If the clutch chatters when the motor is driving the dial, apply more pressure by bending the spring in toward the motor frame. If the clutch fails to release soon enough when the backplate insulator segment reaches the contact, the disk may override the contact and start to reverse. To remedy this fault pressure on the clutch release spring should be loosened by bending the spring out slightly. These same adjustments apply to the remote volume control motor on receivers which have this motor installed.

3. FM-AM relay and power ON-OFF relay

The switch contacts on these relays should be cleaned by applying carbon-tetrachloride with a clean cloth or small brush. The contacts may need slight adjustment at times for if they are too loose, poor contact will result and some of the circuits will not work or if they are too tight the relay may stick and refuse to throw to the proper position. Caution should be exercised when adjusting these contacts in order to maintain proper contact.

4. Muting relay and motor control relays

Since these relays are of very simple construction no adjustment should ever be necessary on them, however the switch contacts may need cleaning at times and the best method of doing this is to use a narrow strip of clean cloth with a little carbon-tetrachloride, burnishing the contacts with a back and forth motion.

5. Backplate contacts and rotor disk

The backplate contacts and rotor disk will be subjected to more wear than any other part of the tuning system. Maintenance will consist essentially in keeping the contacts and rotor disk surfaces clean and maintaining proper contact between the rotor disk and the movable contacts.

In order to clean or adjust the backplate contacts it is necessary to remove the backplate and the rotor disk from the receiver as follows:

1. Remove the horseshoe clamp washer from the end of the rotor disk shaft.

2. Remove the two screws holding the bottom of the backplate to the chassis and the two screws holding the brackets of the backplate to the top of the chassis base.

3. Loosen the two set screws which hold the rotor disk to the flexible coupling.

4. Pull the backplate away from the receiver chassis and remove the rotor disk.

5. The contacts and rotor disk can be cleaned by wiping them with a clean cloth using carbon-tetrachloride. The contacts should then be adjusted so that the tip of the contact is 11/16" from the inside surface of the backplate.

   If the insulating segment is badly worn it can be easily replaced by removing the segment at the end of the insulating strip marked with the Figure 1 and replacing with a new segment.

6. The rotor disk can now be reinserted into the backplate bearing and the flexible coupling, and the backplate fastened back onto the receiver chassis. Then insert the clamp washer back onto the rotor shaft.

7. In order to properly position the rotor disk so that the original setting of the contact knobs will still be the same, proceed as follows:

   1. Set the No. 1 contact knob at the extreme end of the top slot in the backplate.

   2. Set the dial at approximately 600 kilocycles or 20 on the logging scale.

   3. Set the rotor disk so that the end with the insulated segment marked 1 is slightly above center and tighten down one of the set screws in the flexible coupling.

   4. With the receiver turned ON, press pushbutton No. 1 and run until the backplate rotor disk stops.

   5. Loosen up the set screw in the coupling being careful not to change the position of the rotor disk, then while holding the rotor disk firmly so that it will not move, turn the dial tuning knob until the dial pointer is at the extreme left side of the scale.

   6. Tighten down both set screws in the flexible coupling. The backplate will now be in the original position as set at the factory and if the contacts have not been moved all the previous contact knob settings should remain the same.

©John F. Rider

6.5 Record Changer Maintenance

For information on adjustments and lubrication the instruction manual furnished with the record changer should be consulted.

On most of the pickup cartridges furnished with the record changers, the needle is held in place by means of a set screw. If this set screw becomes loose the needle may turn sideways in the cartridge and will not seat properly in the needle groove or will sound distorted. The needle furnished is of the precious metal, long life type and if it is found necessary to replace it or if it becomes loose in the cartridge, remove the two screws holding the cartridge in the pickup arm and drop the cartridge out of the arm. The set screw can be loosened and the needle either replaced or set at the proper position again. The bent shank portion of the needle should face straight out from the pickup cartridge. Caution should be used in replacing the needle not to apply too much pressure on the set screw as this may cut through the plastic shank of the needle and ruin the reproduction.

6.6 Voltage and resistance tests

Table 2 lists the tube socket voltages for various settings of the controls. All voltages are measured between the chassis and socket terminals. Voltage measurements listed are made with a DC voltmeter of 1000 ohms per volt using the highest range scale that can be easily read. The receiver should be connected for normal operation and the controls adjusted as listed in Table 2. Line voltage should be 115 volts 50-60 cycles. Resistance measurements are listed in Table 3. All resistance measurements are made between chassis and terminals listed. The most suitable scale for the measurement being taken should be used. The receiver should be disconnected from the power source with controls adjusted as follows: Selectivity - sharp, Treble - max., Sensitivity - as listed, AM Band-as listed, Bass - max., Volume - as listed.

Section VII ALIGNMENT DATA

7.1 General

Should realignment of the receiver become necessary the following data should be carefully studied before making any circuit adjustments so that correct alignment may be made quickly and accurately.

The complete alignment of the radio receiver may be divided into the following steps. The circuits should be checked in the order listed.

Amplitude Modulation Channel

1. AM-IF amplifier alignment
2. AM oscillator alignment
3. AM-RF amplifier alignment

Frequency Modulation Channel

1. FM-IF amplifier alignment
2. FM discriminator alignment
3. FM oscillator alignment
4. FM-RF amplifier alignment

The receiver must be removed from the cabinet and connected as for normal operation on the power source specified for the receiver. The bottom plates must be removed from the receiver and power supply chassis and for realignment of the FM-RF circuits, the cover over the main tuning capacitor must be removed.

7.2 AM Circuit Alignment

For alignment of the AM circuits the controls should be adjusted as follows:

1. Selectivity control set at "S" Sharp position.
2. Sensitivity control advanced to maximum point just before the noise limiter switch throws.
3. Band change control set to "BC" or "SW" band as noted.
4. Bass and treble controls set at maximum position.
5. Volume control set as noted.

7.21 AM-IF Amplifier Alignment

The intermediate frequency of the AM-IF channel is 455 kilocycles.

Tuning adjustments are provided in each transformer. These adjustments consist of adjustable powdered iron cores and are designated on the circuit diagram by symbols E9 to E13 inclusive. All adjustments for the AM-IF channel are on the receiver chassis.

An output meter must be connected across the voice coil leads of the speaker on terminals 3 and 5 of the speaker receptacle in the power supply chassis when the 15 inch Jensen coaxial speaker is used or across terminals 1 and 5 when the 15 inch Tru-sonic single speaker is used. This connection is changed for different speakers because of the difference in voice coil impedance which is 8 ohms for the Jensen coaxial speaker and 16 ohms for the Tru-sonic speaker.

The high potential lead of the signal generator should be connected to the control grid (terminal #8) of the AM mixer, tube V3-6SA7 through a .005 to .05 mfd capacitor and the ground lead of the signal generator connected to any metal part of the chassis. The volume control should be advanced to a point where the noise level of the receiver starts to indicate on the output meter.

The frequency of the signal generator should be carefully adjusted to 455 kilocycles, modulated 30% at 400 or 1000 cycles and the signal input to the mixer tube adjusted to provide a reading on the output meter. The signal input should be kept at a low level so as not to overload the second detector or audio circuits and to keep the AVC voltage as low as possible. If a high signal level is used the AVC voltage developed by the second detector may become so high as to cause the trimmer adjustments on the IF transformer to appear very broad in tuning and a false indication of true resonance will result.

Starting with the 3rd IF transformer the adjustments should be set for maximum output in the following order E13, E12, E11, E10 and E9.

The sensitivity of the IF amplifier can be checked against the following figures to ascertain that each stage is in proper working order.

Input Terminal	Signal Input Microvolts	Output Mod. On	Output Mod. Off
2nd IF V5 Grid	6000	1 volt	.1 volt or less
1st IF V4 Grid	200	1 volt	.1 volt or less
Mixer V3 Grid	35	1 volt	.1 volt or less

The above measurements are made at a 10 db signal to noise ratio with the output voltage shown measured across an 8 ohm voice coil. If the speaker has a 16 ohm voice coil the voltage with Mod. ON will be 1.4 volts and with Mod. OFF .14 volts.

The selectivity control should be set at "S" (Sharp) position, Sensitivity control at maximum with noise limiter switch off and Volume control at maximum. The oscillator tube V2-6J5 should be removed.

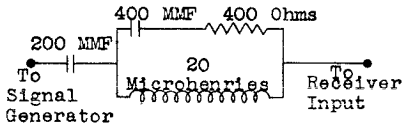
7.22 AM-RF and Oscillator Alignment

Caution: Readjustment of the oscillator circuit trimmers should not be attempted until after the need for such readjustment has been positively established. The following table gives the alignment frequency, trimmer adjustments and nominal sensitivity for the "BC" and "SW" bands. Sensitivity measurements are for a 6 db signal to noise ratio.

Band	Freq.	Adjustment			Signal Input	Output Mod.ON	Output Mod. OFF
		Osc.	Mixer	Ant.			
BC	1500 KC	C6	C15	C1	5 uv	1 Volt	.5 V or less
	1000 KC	E5			5 uv	1 Volt	.5 V or less
	600 KC	C8	E7	E3	5 uv	1 Volt	.5 V or less
SW	16 MC	C10	C16	C2	8 uv	1 Volt	.5 V or less
	6.5 MC	E6	E8	E4	8 uv	1 Volt	.5 V or less



The signal generator should be connected through a standard RMA dummy antenna to the AM antenna input terminal E1. The center terminal of E1 should be connected to the ground terminal with a short jumper wire. The controls should be set as follows:

1. Selectivity control set to "S" (Sharp) position.
2. Sensitivity control set at maximum position with noise limiter switch off.
3. Bass and treble controls set at maximum.
4. AM Band control set to band desired.
5. Volume control set as noted.

It is important that the oscillator circuits operate on the high frequency side of the signal circuits, particularly on the SW Band where the trimmer will allow the oscillator circuit to be resonated on either the high or low side of the signal circuits. When properly aligned the image will appear 910 KC lower in frequency than the signal being received and it will be considerably weaker than the signal, therefore, it will be necessary to increase the output of the signal generator in order to check the image.

The following general procedure should be employed in the alignment of the AM oscillator and RF amplifier circuits.

1. Turn dial to extreme left side of scale and make certain that the pointer lines up with the zero designation on the top logging scale
2. Set the signal generator to the high frequency alignment point of the desired band.
3. Set the dial pointer of the receiver to the high frequency alignment point of the desired band.
4. Adjust the oscillator trimmer capacitor until the signal is tuned in to resonance, then adjust the mixer and antenna circuit trimmer capacitors for maximum reading on the output meter.
5. Set the signal generator and receiver dial pointer to the low frequency alignment point.
6. Set the low frequency oscillator trimmer adjustments outlined in chart ~~on Page 42~~ until the signal is tuned to resonance, then adjust the mixer and antenna adjustments for maximum output.
7. Repeat this entire alignment procedure as a final adjustment.

On the BC band an adjustment E5 is provided for alignment of the oscillator circuit at 1000 KC. This adjustment should not be altered unless the calibration of the BC Band is still off frequency after the trimmer adjustments for the high and low frequency ends of the band have been adjusted.

7.3 Frequency Modulation Circuit Alignment

7.31 FM-IF Circuit Alignment

For alignment of the FM circuits the controls should be adjusted as follows:

1. Turn receiver on and push one of the FM pushbuttons to switch the receiver over to FM reception.
2. Set bass and treble controls at maximum position.
3. Adjust volume control as noted.

7.32 FM-IF Amplifier Alignment

The intermediate frequency of the FM channel is 10.7 megacycles. Tuning adjustments are provided in each IF transformer. These adjustments consist of powdered iron cores in the IF transformer and variable air capacitors in the discriminator transformer. These adjustments are designated by symbols E17 to E26 inclusive for the IF transformers and C80 and C82 for the discriminator transformer. The 1st FM-IF transformer primary adjustment E17 is located on the receiver chassis. The other adjustments are located on the power supply chassis.

The high potential lead of the signal generator should be connected to the control grid (Pin #4) of FM mixer tube V13-6AG5 through a .01 mfd capacitor, and the ground lead connected to the chassis frame. A high resistance DC voltmeter such as the RCA Volt-ohmyst should be connected across the second limiter filter resistor R72.

Set the signal generator to 10.7 megacycles and feed in a signal with modulation OFF until the meter reads 1.5 volts.

Starting with the 4th IF transformer T6, adjust the trimmers in the following order: E26, E25, E24, E23, E22, E21, E20 and E17. Each trimmer should be adjusted for maximum meter reading, keeping the input from the signal generator at a point where not more than 1.5 volts output is obtained on the meter. It is important to keep the signal input down so that meter does not read more than 1.5 volts as above this the limiters start to level off and the IF adjustments will act very broad and cannot be set to the true resonant position.

7.33 FM Discriminator Circuit Alignment

Set the signal generator at 10.7 megacycles and connect to the grid (Pin #4) of mixer tube V13-6AG5 through a .01 mfd capacitor. Connect the Volt-ohmyst or equivalent meter to the discriminator diode output at the junction of R78 and C84 to ground. If a volt-ohmyst or equivalent meter with polarity reversing switch is not available a zero center 50-0-50 microammeter can be used.

If the discriminator is correctly aligned the meter will read zero when the signal generator is set to 10.7 megacycles. If the meter reads either plus or minus realignment is necessary. The secondary trimmer C82 at the bottom of the discriminator transformer should be detuned so that the meter reads either plus or minus. The primary trimmer C80 at the top of the transformer should then be realigned for maximum output. The secondary trimmer C82 should now be carefully adjusted for zero reading on the meter.

Next adjust the signal generator 75 KC higher in frequency or 10.775 MC and record the reading of the meter. Then set the signal generator 75 KC lower in frequency or 10.625 MC and record this reading of the meter. These two readings should be identical, if they are not a slight readjustment of the primary trimmer C80 should be made to coincide these readings at plus and minus 75 KC from 10.7 megacycles. The zero voltage setting of the secondary trimmer C82 should then be rechecked for if this adjustment is not correctly made distortion on FM signals will result.

7.34 FM-RF and Oscillator Circuit Alignment

All the trimmer adjustments for the FM-RF and oscillator circuits are located on the top of the receiver chassis and it is necessary to remove the cover over the main tuning capacitor for access to these trimmer adjustments.

The signal generator should be connected to the FM antenna terminal E2 with a 50 ohm carbon resistor in series with the high potential lead of the generator and the center antenna terminal of E2 shorted to the ground terminal.

The FM oscillator circuit operates on the low side of the signal circuits and no trouble with aligning the oscillator circuit on the image should be encountered since it will be twice the IF frequency or 21.4 megacycles away from the signal frequency and the trimmer capacitor will not allow this much variation. The following chart lists the trimmer adjustments.

The high resistance DC voltmeter should be connected across the second limiter grid filter resistor R72. The sensitivity measurement given in the chart below is for 1.8 volts output as read on the high resistance DC voltmeter.

Band	Freq. MC	Adjustment			Sensitivity
		Osc.	Mixer	Ant.	
FM	106	C43	C49	C39	15 microvolts for 1.8 volts
	90	E15	E16	E14	Across limiter resistor R72

INSTALLATION AND SERVICE DATA ON REMOTE CONTROL KEYBOARD FOR USE WITH MODEL 800-BR RADIO-PHONOGRAPH

Remote Keyboard

The remote control keyboard is provided in order that the Model 800-BR Radio-Phonograph may be controlled from remote points in the same room or in other rooms of the house. It is provided with 16 pushbuttons, 12 of which are used to tune in stations exactly the same as the push-buttons on the front panel of the receiver. Two buttons are used to turn the receiver ON and OFF and the two remaining pushbuttons are used to raise and lower the volume of the receiver as shown in Figure 1.

The remote keyboard was designed for use with the Model 800-BR Receiver which is the same as the Model 800-B with the addition of a motor driven volume control. The keyboard will however, work with the standard Model 800-B Receiver chassis without any changes having to be made in wiring. However, the volume cannot be controlled from a remote point. The receiver cannot be turned ON or OFF from the keyboard and the indicator lamp in the kayboard will not light.

The keyboard is provided with 20 feet of flat cable and a 21 contact plug which inserts into the 21 contact receptacle at the rear of the receiver. Any length of cable can be furnished upon request.

For installations where the keyboard is to be located in one or more positions remote from the room where the radio-phonograph is placed, an outlet box with a 21 contact receptacle should be mounted in the wall behind the radio-phonograph. This receptacle can then be connected to one or more receptacles located in different parts of the house by means of a round multi-conductor cable, all receptacles being wired in parallel. If more than one remote outlet box is used, a junction box should be used to terminate the cables from all outlets to facilitate wiring and servicing. A short piece of flat cable with 21 contact plugs on both ends is then inserted between the receptacle on the chassis and the receptacle in the wall at the rear of the radio-phonograph. A keyboard may then be inserted in any of these receptacles and the receiver operated from any point.

The pictorial diagram of the keyboard is shown in Figure 2 which shows the contact layout with the connections numbered to correspond with the numbers of the connections on the 21 contact plug. The schematic diagram of the keyboard is shown in Figure 3.

The keyboards are wired at the factory so that buttons 5, 6 and 7 are used to select FM stations while buttons 1, 2, 3, 4, 8, 9, 10, 11 and 12 are used to select AM stations. Any of the buttons now wired for FM may be used for AM station selection by disconnecting the jumper wire for that particular button from the FM common lead No. 15 and connecting the jumper wire to the AM common lead No. 13 and by reversing this procedure any of the buttons now used for AM can be used for FM. If the pushbuttons on the receiver have been changed so that more AM or FM stations can be tuned in, after the set has been received from the factory, it will be necessary to make the same changes on the keyboard pushbuttons as the receiver will not operate properly, for example:

If button No. 5 has been changed to tune in an AM station on the receiver push-button switch gang, when the keyboard is plugged in and button No. 5 is pushed the set will switch over to FM reception and if no FM station happens to be located at the point on the dial scale where button No. 5 contact is set nothing will be heard but background noise, therefore, it is necessary to change the wiring of No. 5 switch in the keyboard from the FM common lead over to the Am common lead, then button No. 5 on the keyboard will tune in exactly the same station as button No. 5 on the receiver chassis.

The two buttons marked ON and OFF are provided to control the volume of the receiver without having to go all the way back to where the receiver is located. The two buttons on either side of the lamp bezel are used to turn the receiver ON and OFF. The button on the right side turns the set ON while the button on the left side turns it OFF. When the receiver is turned ON, the indicator in the keyboard will glow.

The lamp used for the indicator is a standard 30 volt switchboard lamp which has a very long life. It can easily be replaced when necessary by removing the four screws on the bottom of the keyboard, removing the bottom plate then sliding out the old lamp and inserting the new one.

REMOTE VOLUME CONTROL MOTOR

The remote volume control motor consists of a reversible type motor operating on 24 volts 60 cycle AC. This motor drives the volume control through a gear train and a clutch. The shaft of the intermediate gear is extended in order that the volume control may be manually operated at the front of the receiver. The clutch is provided in order that damage will not be incurred if the motor is kept running momentarily after the volume control has reached the end of its travel.

The schematic diagram shown in Figure 4 and the pictorial diagram shown in Figure 5 depict the changes in wiring necessary when the remote volume control motor is added to the standard 800-B Radio Receiver chassis.

INSTRUCTIONS FOR INSTALLING REMOTE VOLUME CONTROL MOTOR IN 800-B RADIO RECEIVER CHASSIS

By utilizing the following instructions and the pictorial diagram of Figure 5 the remote volume control may be easily installed in a standard Model 800-B Receiver chassis. It is necessary to remove the panel and knob escutcheon plate before proceding with the installation.

1. Remove the angle cover plate over the cutout used for mounting the volume control motor.

2. Disconnect the three leads from the volume control and remove it from the chassis.

3. Fasten the volume control bearing plate on the inside of the chassis using two 6-32 x 5/16 screws and two nuts. Center the 1/4 inch hole in the bearing plate in the 3/8 inch hole used to mount the old volume control.

4. Remove the screws fastening capacitor C37 and resistor strip E43 to the side of the chassis and push these two items toward the rear of the chassis as far as the connecting leads will allow.

SCOTT
REMOTE CONTROL
KEYBOARD

FIG. 1

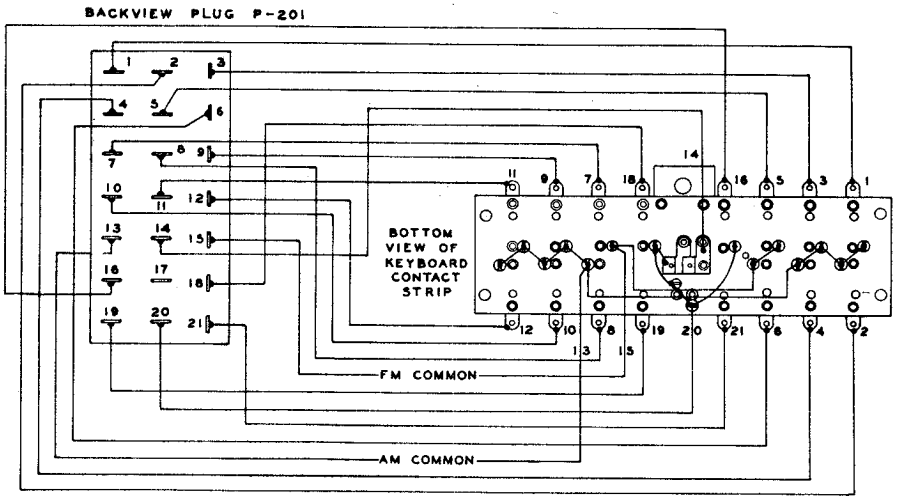

FIG. 2 PICTORIAL DIAGRAM OF KEYBOARD WIRING

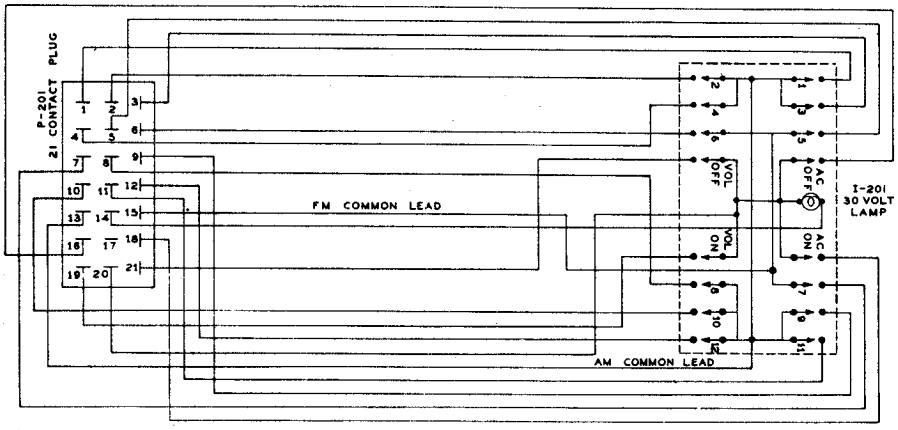

FIG. 3
SCHEMATIC DIAGRAM KEYBOARD ASSEMBLY 2B945

©John F. Rider

©John F. Rider

5. Insert the tuning motor assembly in place and fasten down with two 5-40 x 1/4 BH screws and two 6-32 x 1/4 BH screws as shown in Figure 5. The two 5-40 x 1/4 BH screws are used to mount the motor assembly spacers to the chassis while the two 6-32 x 1/4 BH screws are used to mount the motor assembly bracket to the chassis. Make certain that the manual drive shaft rotates freely in the bearing plate. If not, loosen the bearing plate mounting screws and center it properly over the shaft, then tighten down again.

6. Reconnect the volume control leads as shown in Figure 5 using the tie point mounted on the motor frame for connecting the shield braids of the two shielded leads. The off terminal of the volume control should then be connected to this tie point by a short piece of wire.

7. Connect wire W201 as shown in Figure 5 from contact No. 16 of the 21 contact receptacle J6 to one terminal of the AC relay coil L21.

8. Connect wire W202 from contact No. 18 of receptacle J6 to one terminal of AC relay coil L20.

9. Connect wire W203 from contact No. 19 of receptacle J6 to terminal No. 1 of the volume control motor as shown in Figure 5.

10. Connect wire W204 from contact No. 21 of receptacle J6 to terminal No. 2 of the volume control motor.

11. Connect wire W205 from terminal X of AC relay switch SW5 to terminal No. 3 of volume control motor as shown in Figure 5.

12. Connect resistor R201 between contact No. 14 of receptacle J6 and contact X of AC relay switch SW5 as shown in Figure 5.

13. Check the wiring of the common terminal of the pushbutton system transformer in the power supply. In the older sets this terminal was grounded to a soldering lug fastened under one of the transformer mounting screws. It will be necessary to remove this short lead and run a wire from the common terminal of the transformer over to No. 10 contact of the 12 contact receptacle J3. This change is necessary in order to eliminate hum when operating the volume control motor.

14. When connecting in the wires outlined above, they should be run in under the present cables in order to hold them in place and present a neater appearance.

After the wiring has been completed, connect the set for normal operation, plug in the keyboard and with the controls on the receiver set the same as for pushbutton tuning operation, operate all the buttons on the keyboard to make sure the installation has been correctly made. Then reassemble the knob escutcheon plate and panel. It will be noted that when the volume control is now operated manually that seven complete revolutions will be necessary to turn it from minimum to maximum.

If the motor clutch chatters while running or if the clutch does not release immediately when either of the volume control pushbuttons are released, it will be necessary to adjust the clutch release spring on the back of the motor. If the clutch chatters, release pressure on the spring and if the clutch fails to release immediately apply more pressure on the spring.

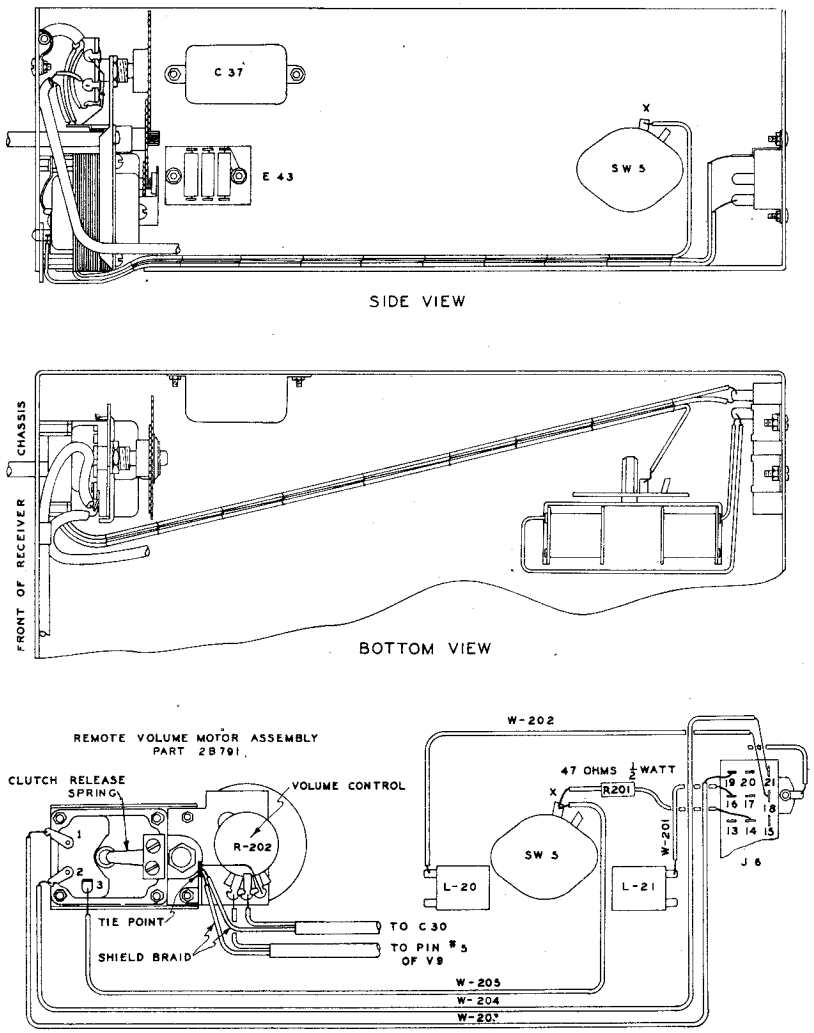

FIG. 5 PICTORIAL DIAGRAM OF CHANGES NECESSARY TO ADD REMOTE VOLUME CONTROL IN STANDARD 800 B RECEIVER CHASSIS

Technical Data

Power Requirements	117 volts AC 60 Cycles Current Consumption 197 Watts Normal-310 Watts Maximum
Audio Power Output	25 watts undistorted 40 watts maximum
Audio Frequency Range	35 to 20,000 cycles
Overall Frequency Range - AM	35 to 8,500 cycles
Overall Frequency Range - FM	35 to 15,000 cycles
Tuning Range - AM	540 KC to 1600 KC 5.9 MC to 18.2 MC
Tuning Range - FM	88 to 108 MC

Installing Loudspeaker

The loudspeaker baffle is provided with four small holes provided as pilot holes for the wood screws used to fasten the speaker to the baffle. The loudspeaker may easily be located over the baffle opening by first centering the speaker over the opening with connecting cable at the bottom. The speaker should then be fastened down with the wood screws provided. The speaker should be fastened down firmly but DO NOT tighten the screws so as to warp or pull the edge of the speaker frame as this will throw the voice coil out of alignment and cause the speaker to distort.

Installing Power Supply Chassis

The power supply chassis should be fastened to the lower shelf of the cabinet by means of four wood screws provided. It should be fastened down in a position where the fuse receptacles and connecting cable receptacles are readily accessible.

Installing Receiver Chassis

The receiver chassis has been designed so that it can be rolled in or out of the front of the cabinet with a spring latch arrangement which holds the receiver at a position where the front of the panel extrudes out approximately 2 inches for ease in tuning. By releasing the spring latches on both sides of the panel the receiver may be rolled out approximately 10 inches for inspection of the receiver or tube replacement.

The receiver should be installed in the cabinet using the following procedure:

1. The front panel is mounted on the chassis as shown in Figure 1 using the hardware furnished.

2. Next mount the latch springs on the sides of the receiver chassis as shown in Figure 1. The retaining screw which is used to center the latch spring in the slot on the side of the panel should be screwed in far enough to bring the latch spring flush with the outside of the panel. It may be necessary to adjust the screw on the latch spring further in to make the latch catch smoothly when the set is pulled out. However, DO NOT leave the latch adjustment screws sticking out beyond the sides of the panel as they may catch in the latch spring plate when the set is pushed into the cabinet.

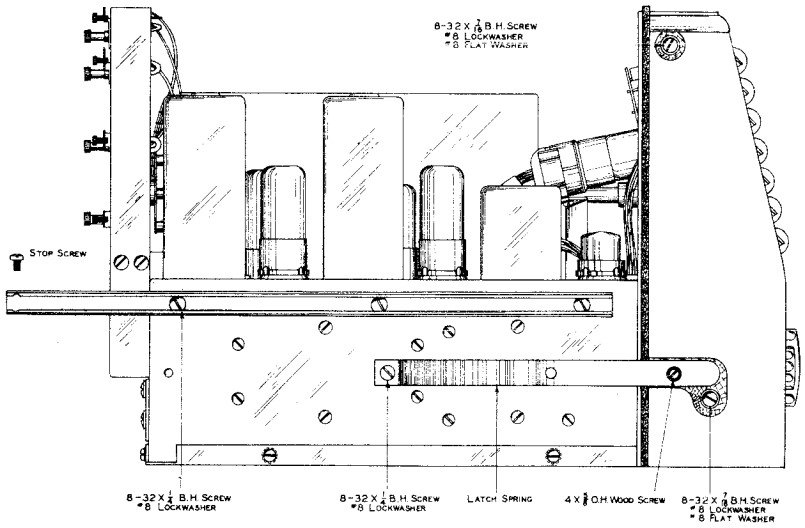

Figure 1 800-B Radio Receiver - Side View

3. Mount the slide rails on the sides of the receiver chassis as shown in Figure 1 using the hardware provided for this purpose. Remove the stop screws from the ends of the rails as shown.

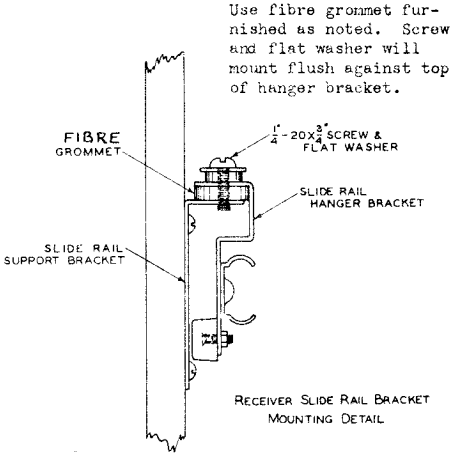
4. Open the door of the cabinet and slide it back inside as far as it will go.

5. Fasten the slide rail hanger brackets, which are packed with the receiver, onto the support brackets which are mounted in the cabinet using the rubber grommets, screws and flat washers furnished with the receiver, as shown in detail drawing Figure 2.

6. Insert the rails on the receiver into the slides which are mounted in the cabinet and slide the receiver back into the cabinet.

7. Insert the stop screws in the ends of the slide rails.

8. Open the cable hole clamp at the back of the cabinet and lay the cables in the slot provided. The cables may then be inserted in their respective receptacles in the power supply. DO NOT force the plugs as they are polarized and will enter the receptacle in only one position.



Use fibre grommet furnished as noted. Screw and flat washer will mount flush against top of hanger bracket.
FIBRE GROMMET
1/4-20 X 3/4 SCREW & FLAT WASHER
SLIDE RAIL HANGER BRACKET
SLIDE RAIL SUPPORT BRACKET
RECEIVER SLIDE RAIL BRACKET MOUNTING DETAIL

Figure 2

©John F. Rider

9. Insert the screw eye furnished, under the top at the rear of the cabinet in the center of the receiver compartment and tie the connecting cables to the screw eye leaving enough slack so that the receiver will pull all the way out without pulling the cables tight. This will allow the cables to loop when the receiver is run in and out of the cabinet.

Installing the Record Changer

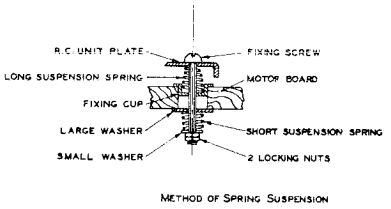
The record changer furnished with the receiver is designed for floating spring mounting. Although it is not necessary to remove the drawer to install the changer, it will be much more convenient to do so. The back of the compartment should be removed; then remove the slide rail stop screws, the drawer can then be removed from the cabinet.

Remove the spindle and turntable. Then mount the changer with the hardware provided, following the method shown in Figure 3.

CAUTION: DO NOT LIFT THE RECORD CHANGER BY THE PICKUP ARM OR THE OVER-ARM AS UNDUE STRAIN ON THESE PARTS WILL PUT THE CHANGER OUT OF WORKING ORDER.

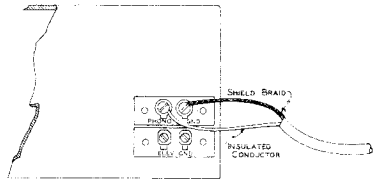
The drawer can now be reinserted in the cabinet, feeding the record changer power cord and pickup leads through the hole in the center of the shelf. Put the stop screws back in the slide rails and fasten the back of the cabinet on.

The power cord for the record changer should be inserted in the power receptacle which is fastened to the power chassis by a short cord, and the pickup cord connected to the PHONO-GND terminals at the rear of the receiver; connect the shield braid to the GND terminal, and the insulated conductor to the PHONO terminal as shown in Figure 4.



METHOD OF SPRING SUSPENSION

Figure 3



RECORD PLAYER PICK-UP CONNECTIONS

Figure 4

Antenna Connections

The Model 800-B Radio Receiver is designed to be used with either a straight antenna with single conductor lead-in or a doublet type antenna with 2 conductor lead-in. Separate connections are provided for antenna on AM and FM bands and for best reception a doublet type antenna should be used on the AM bands with a separate dipole antenna for the FM band as shown in Figure 5.

A double doublet antenna with pretuned matching transformer such as the SCOTT Double Doublet Antenna system will give maximum transfer of signal energy with greatest noise reduction on both broadcast and shortwave bands and a horizontal dipole with the flat top legs cut to the correct length for operation in the 88-108 megacycle band used with a two conductor lead-in with low-loss properties will give maximum results on the FM band.

In installations where it is not possible to install a doublet antenna system, a single wire antenna with the flat top 60 to 75 ft long and the lead-in as short and direct as possible, should be used. For FM reception a small mica capacitor of 51 MMF may be connected between the AM antenna connection and the FM antenna connection as shown in Figure 7.

A four contact receptacle is provided, at the rear of the receiver chassis for using a loop antenna on the "BC" and "SW" bands in metropolitan areas where a number of powerful stations may be located. It is not recommended that a loop antenna be used for receiving distant stations. Directions for installing the loop antenna are furnished with each antenna.

A two position switch with a screwdriver slot located at the left of the loop receptacle is provided so that the input circuits of the receiver may be connected to the loop antenna or an outside antenna. This switch should be set in the counter-clockwise position for use with an outside antenna and set to the clockwise position for use with the loop antenna.

TUNING THE RECEIVER

After the receiver has been installed in the cabinet and the antenna connections, record changer connections and power line connections are made, the receiver is ready for operation. Push the "ON" button to turn the receiver on, then for initial operation set the controls as follows:

Pushbutton Operation

1. Set SELECTIVITY control to "M" or "B" position.
2. Set AM-BAND control to "BC" position.
3. The SENSITIVITY control should be set at approximately vertical position or half rotation but it can be adjusted to suit receiving conditions, however, it is effective only on the "BC" and "SW" bands.
4. Press the button which is marked with the desired station call letters, holding the button down until the dial mechanism stops.
5. Adjust the VOLUME control to the desired level and the BASS and TREBLE controls for the tone quality desired.

In order to change from AM reception to FM reception the SELECTIVITY control must be set at "M" or "B" position and the AM BAND control set at "BC" position then by pushing any AM button the set automatically switches to AM reception and if any FM button is pushed the receiver automatically switches to FM reception. The indicator lamps behind the colored dots at the end of the frequency scale are also automatically switched with the above procedure.

Manual Operation in the AM-Broadcast Band

1. Set receiver for AM reception as outlined above.
2. Set SELECTIVITY control to "S" (sharp) position.
3. Set TREBLE control to approximately vertical position.
4. Set SENSITIVITY control to approximately vertical position.

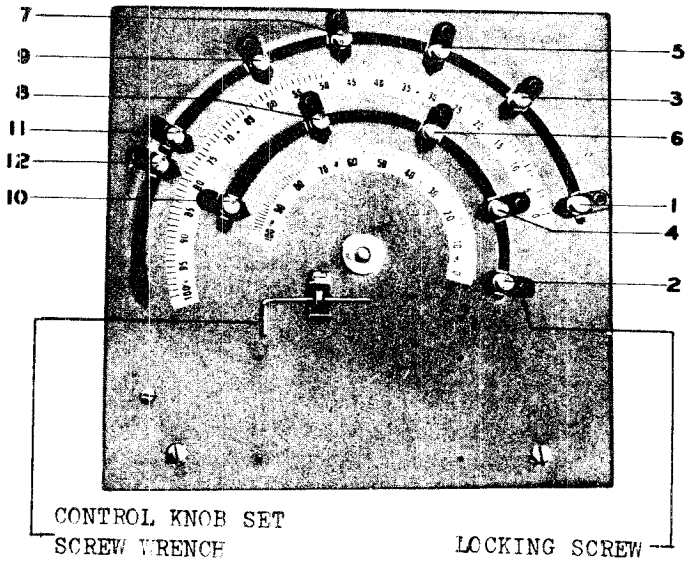
CONNECTIONS FOR USING SINGLE WIRE ANTENNA FOR AM AND FM

Figure 7



CONTROL KNOB SET SCREW WRENCH

LOCKING SCREW

Figure 9 Pushbutton Tuning Backplate

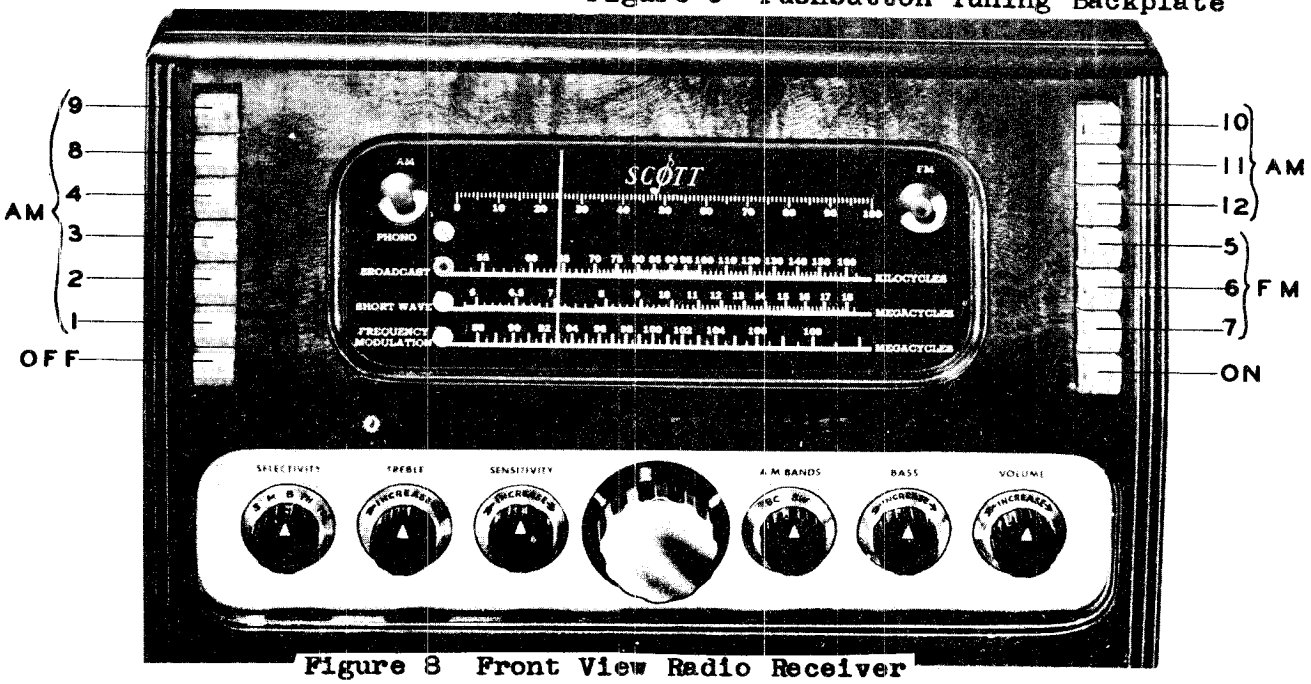


Figure 8 Front View Radio Receiver

©John F. Rider

5. Set AM BAND control to "BC" position.

6. Set BASS control to approximately vertical position.

7. Tune in a station with the MAIN TUNING control using the AM tuning eye to indicate when the set is properly tuned, then adjust the VOLUME control for desired volume level.

8. Advance SELECTIVITY control to "M" or "B" position for desired fidelity, then adjust the TREBLE and BASS controls for desired tone.

9. When tuning for weak distant stations, advance the SENSITIVITY control and when tuning strong local stations turn back the control to eliminate noise between stations.

Manual Operation in the AM-Shortwave Band

1. Set controls as above except the AM-BAND control set to "SW" position.

2. When tuning on the Shortwave Band the SENSITIVITY control should be advanced to near maximum position. If automobile ignition noise or other noise with decided peaks is encountered, the SENSITIVITY control should be advanced to maximum until the switch mounted on this control clicks. This will put the noise limiter circuit into operation and will reduce the noise so that weak stations can be heard.

Manual Operation on the FM Band

1. With the SELECTIVITY control set at "M" position and AM-BAND control set at "BC" position, push any of the pushbuttons which are set up for FM reception. The set will automatically switch to FM reception and the lamp behind the colored dot marking the FM Band will be illuminated.

2. Tune in an FM station noting carefully that the dial is tuned to the point where maximum closure is obtained on the FM tuning eye.

OPERATION OF CONTROLS

All operating positions of the controls of the Model 800-B Radio Receiver, with the exception of the Main Tuning Control, are marked, and indicator markings on the knobs are provided so that adjustment of the controls for various operating conditions is easily accomplished.

Six variable controls plus the main tuning control are provided so that maximum efficiency may be obtained at any operating condition. The functions and settings of the operating controls are listed below.

1. SELECTIVITY Control

The SELECTIVITY control located at the left side of the panel has five positions marked S-M-B-PH-Tel. The S-M-B positions are effective only for AM (amplitude modulation) reception on the "BC" and "SW" Bands. They designate the "Sharp", "Medium" and "Broad" condition of the AM-IF amplifier. The "S" position should be used at all times when manually tuning in stations as the IF amplifier is so broad in the "M" and "B" positions that a true resonant point cannot be obtained with the tuning eye. After the station has been tuned in properly in the "S" position the control may be advanced to the "M" or "B" position to obtain better fidelity.

When the SELECTIVITY control is set at "PH" position it connects the record changer pickup into the audio circuit of the receiver and provides for record reproduction.

With the SELECTIVITY control set at "TEL" position, the audio amplifier of the receiver is connected to the television input terminals at the rear of the receiver. These terminals are provided so that a television tuner may be connected to the 800-B Receiver and the audio amplifier of the receiver used for reproduction of television sound broadcasts, while the picture will be reproduced at the television tuner.

2. TREBLE Control

The TREBLE control is located at the right of the selectivity control and is provided in order that the high frequency response of the audio amplifier in the receiver may be changed to suit operating conditions and program material. Maximum high frequency response is obtained with this control set at maximum clockwise position.

3. SENSITIVITY Control

The SENSITIVITY control is located at the right of the treble control. This control is effective only on the AM broadcast and shortwave bands and is provided to vary the sensitivity of the receiver. When manually tuning the receiver the control should be set to the position where the AM tuning eye shadow just closes or on weak stations to the point where maximum closure of the tuning eye is obtained. For maximum sensitivity when tuning in weak distant stations the control should be advanced to the point where the switch incorporated on this control just starts to throw. The switch mentioned above which is incorporated in the SENSITIVITY control is provided to switch the Noise Limiter Circuit on and off. When the control is advanced to maximum clockwise rotation, the switch will throw on. The Noise Limiter Circuit with which this switch is associated, is effective on noises which have definite peaks, such as automobile ignition, it will have very little effect on noise which is of constant amplitude. Although the switch may be turned on or off when the set is tuned to any frequency band, it is effective only on the AM shortwave band.

4. MAIN TUNING Control

The MAIN TUNING control is the large knob in the center of the panel. This control is provided for tuning the receiver to the station frequency desired.

5. AM-BAND SELECTOR Control

The AM-Band switch is located at the right of the main tuning control. This control is provided in order that either the broadcast or shortwave bands may be selected for AM reception. This control is effective only for AM reception.

6. BASS Control

The BASS control is located at the right of the AM-Band control. This control is provided to enable the listener to raise or lower the bass response of the receiver to suit operating conditions and program material. Maximum bass response is obtained when this control is rotated to maximum clockwise position. Turning the control counter-clockwise will reduce the bass response.

©John F. Rider

©John F. Rider

7. VOLUME Control

The VOLUME control is located at the right side of the panel. This control is provided to regulate the audio output or "Volume" of the receiver. Maximum volume is obtained when this control is rotated to maximum clockwise position; zero output is obtained when the control is rotated to maximum counter-clockwise rotation. On standard 800-B Receivers this control will operate from minimum to maximum through an arc of 270 degrees. On receivers where remote volume control has been incorporated, the control will rotate seven complete revolutions from minimum to maximum since this control is driven by a motor controlled from the remote position, therefore when manually tuning the set it will be necessary to turn the control considerably more than is the case on the standard receiver.

8. PUSHBUTTON OPERATION

Fourteen pushbuttons are provided on the panel of the receiver. The bottom button on the right side is provided to turn the receiver "ON" when this button is pushed in. The bottom button on the left side shuts the receiver "OFF" when pushed in. The other twelve buttons are provided for selecting stations. These twelve station selector buttons are effective only when the SELECTIVITY control is set at "M" or "B" positions and the AM band controls set at "BC" position. A set of insert tabs listing all North American stations is included with each receiver. The sequence in which the inserts should be placed and the method of setting up the tuning system for pushbutton control is described above.

After the pushbutton tuning system has been set up for operation , when any pushbutton which has been set for an AM station is pushed the receiver will automatically switch over for reception of AM broadcast stations. When any pushbutton which has been set up for an FM station is pushed, the receiver will automatically switch over for reception of FM stations. When manually tuning the receiver, in order to switch from AM to FM or vice-versa, it is only necessary to push any AM or FM button momentarily and the circuits will be switched automatically.

9. TUNING INDICATORS

In the upper right and left hand corners of the dial scale are located two tuning indicators which are provided to enable the operator to properly tune the receiver to resonance with the station when manually tuning. The indicator in the left hand corner is marked AM and is used only when tuning in stations on the broadcast or short-wave bands. The indicator in the right hand corner is marked FM and is used only when tuning in stations on the FM band. A control, with a screwdriver adjustment slot, located on the top of the chassis directly under the FM tuning eye, is provided so that the tuning eye shadow may be made to close on the strongest FM signal for the particular location. This adjustment will then enable the listener to accurately tune the receiver to all FM stations by watching for maximum closure of the FM tuning eye.

10. TUNING DIAL

The three frequency bands are individually calibrated on the edge lighted glass scale. The BC band is calibrated in kilocycles with the last zero omitted on the numeral markings because of space limitations.

The SW band is calibrated in megacycles and the important bands are marked off for ease in tuning.

The FM band is calibrated in megacycles and divided in one-half megacycle divisions for help in tuning.

A scale marked off in 100 divisions located at the top of the dial face, is provided to enable the listener to log stations which may be tuned in on any of the three frequency bands and also permits setting up the pushbutton system.

At the left side of the dial face are located four colored dots which are provided to indicate which frequency band the receiver is operating on and when the receiver is adjusted for record player reproduction. Each dot is illuminated by a small lamp located at the back of the dial mechanism and are automatically turned on with the setting of the controls for changing frequency bands.

TUBE REPLACEMENT

The tube complement of the Model 800-B Radio Receiver is as follows:

Symbol	Type	Application
V1	6SK7	AM-RF Amplifier
V2	6J5	AM Oscillator
V3	6SA7	AM Mixer
V4	6SK7	AM-1st IF Amplifier
V5	6SK7	AM-2nd IF Amplifier
V6	6H6	AM-2nd Detector
V7	6E5	AM-Indicator
V8	6E5	FM-Indicator
V9	6J5	1st Audio Amplifier
V10	6J5	2nd Audio Amplifier
V11	6AG5	FM-RF Amplifier
V12	6C4	FM Oscillator
V13	6AG5	FM Mixer
V14	6AC7	FM-1st IF Amplifier
V15	6AC7	FM-2nd IF Amplifier
V16	6SJ7	FM-1st Limiter
V17	6SJ7	FM-2nd Limiter
V18	6H6	FM-Discriminator
V19	6SL7GT	3rd Audio Amplifier
V20	6L6G	Audio Power Output
V21	6L6G	Audio Power Output
V22	OD3	Voltage Regulator
V23	5Y3GT	Rectifier
V24	5Y3GT	Rectifier

When it is found necessary to replace any tube, by referring to Figures 10 and 11 the location and tube type can very easily be identified.

©John F. Rider

INSTRUCTIONS FOR INSTALLING LOOP ANTENNA

SYSTEM IN MODEL 800-B RADIO-PHONOGRAPH

The loop antenna system is provided for installations in locations where it is found impossible to erect an outside antenna for AM and FM reception. It consists of separate loops for the broadcast and shortwave bands for AM reception, these two loops being coupled to the antenna input circuit of the receiver through a matching transformer which has adjustments for each band in order to insure maximum signal input. A separate folded dipole antenna is provided for FM reception, this antenna being connected directly to the FM antenna terminals.

Figure 1 depicts the manner in which the loop antennas are fastened in the radio-phonograph cabinet, and by using the following instructions, step by step, the installation and adjustment of the antennas may be easily made and maximum results obtained.

1. First install the FM antenna which is a two wire flat cable which has been cut to the proper length and terminals attached. This antenna should be installed around the inside of the receiver compartment of the cabinet, at the rear, as follows:

   a. Place the junction of the antenna proper and the lead-in approximately 2 inches to the left of center and at the extreme outer edge of the back of the compartment with the lead-in facing toward the receiver chassis. Tack the antenna down with the staples furnished, following the contour of the cabinet, inserting a staple at each bend, the ends of the antenna will terminate approximately 8 inches apart at the top inside of the cabinet.

2. The broadcast band loop is installed around the bottom of the cabinet shelf on the Chippendale and Modern style cabinets as shown in Figure 1. On the Regency cabinet it is necessary to install it around the left side of the speaker compartment and under the shelf of the receiver compartment as shown in Figure 2. Although this loop can be installed in other ways, it is best to install it as shown in order to prevent the loop from being too directional. This loop consists of a 5 wire flat cable cut to the correct length, with a two wire flat lead-in attached. To install the BC band loop in the Chippendale and Modern Cabinets, place the junction of the loop and the lead-in under the shelf approximately ½ inch in from the back and 2 inches to the right of the center of the radio compartment, with the lead-in cable facing out from the cabinet. Tack the loop down at this point with the staples furnished and follow around the inside of the cabinet with the rest of the loop fastening it to the bottom side of the shelf. When going around the corner of the cabinet it will be necessary to fold over the loop in order to keep the corners flat as shown in Figure 1. Loop the lead-in up over the edge of the shelf and fasten down at one point to relieve any strain on the junction point of the loop and lead-in. To install the BC band loop in the Regency cabinet, start by fastening the junction of the loop and lead-in the same as in the Chippendale or Modern cabinets but since the Regency cabinets have a record storage compartment it is necessary to fasten the loop around the left side of the cabinet and under the shelf of the radio compartment only, with a small section in back of the record storage compartment as shown in Figure 2. This will apply to any cabinet with a record storage compartment.

3. The shortwave loop consists of a formed copper tubing fastened to the loop coupler coil shield can. This unit is assembled at the factory ready to mount to the chassis. This assembly is mounted under the two screws used to hold the backplate to the chassis as shown in Figure 1. The procedure is as follows:

   a. Remove the screw on the right side of the backplate and loosen the screw on the left side sufficient to allow the long mounting bracket of the loop coupler to slide under. Then reinsert the screw on the right side through the short bracket of the coupler and tighten down both screws.

   b. Insert the loop coupler plug P-301 into the loop receptacle at the rear of the chassis. This plug is polarized and can be inserted only one way.

   c. Connect the broadcast band loop lead-in as shown in the detail in Figure 1.

4. Connect the FM loop antenna to the two terminals marked ANT on the FM antenna terminal strip as shown in the detail of Figure 1.

5. Turn the loop selector switch SW1, which is located directly under the loop coupler on the rear of the receiver chassis, to the clockwise position. The slot will then be in the position shown in Figure 1.

6. After the loop has been installed and connected the receiver should be put in operation and the loop coupler adjusted for maximum signal on the broadcast and shortwave bands. The FM band loop requires no adjustment.

   If a fairly strong signal can be tuned in so that the tuning eye will show deflection at approximately 1500 K C and 600 KC on the broadcast band or 16 MC and 6.5 MC on the shortwave band, the adjustments on the coupler can be made using these signals with the tuning eye as an indicator as follows:

   a. Remove the AM tuning eye from the bracket and face the front of the tube toward the rear of the set so that it can be easily seen when adjusting the loop coupler.

   b. Set the receiver for operation in the AM band and with the selectivity control in the "Sharp" position, make the adjustments outlined below, setting each adjustment for maximum closure of the tuning eye. Figure 3 shows the location of the four adjustments on the loop coupler.

Band	Freq.	Adj.
BC	1500 KC	C-301
BC	600 KC	E-301
SW	16 MC	C-302
SW	6.5 MC	E-302

FIG. 1 MOUNTING OF LOOP ANTENNA IN CHIPPENDALE CABINET

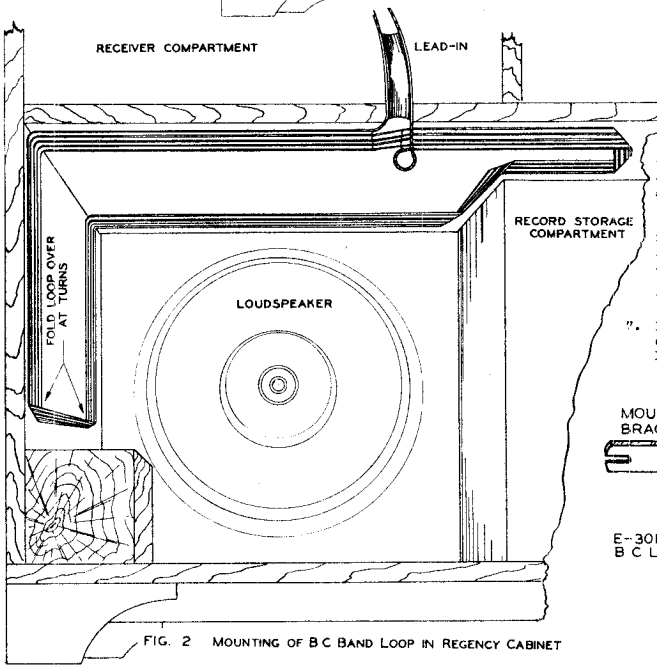

FIG. 2 MOUNTING OF B C BAND LOOP IN REGENCY CABINET

If a strong steady signal is not available for setting the adjustments on the coupler a signal generator must be used with either the tuning eye or an output meter as a signal indicator. The signal generator output terminals are connected to a single turn loop of wire placed adjacent to the loop in the set, the adjustments are made as in the table above keeping the output of the signal generator as low as possible and still maintain a clear signal. In noisy locations it may be necessary to set up a screened booth to do this alignment although this is seldom necessary as the adjustments on the coupler are not critical and with a signal generator a sufficiently strong signal to override the noise level can be obtained so that the adjustments can be made to obtain maximum signal input to the receiver.

". In the Regency cabinet caution should be taken to mount the power supply chassis as far away from the BC band loop as possible to prevent detuning the loop.

MODEL 800-B

SCOTT RADIO LABS. INC.

In a high fidelity instrument such as the Model 800-B a very wide range of audio frequencies are reproduced and the hum problem is of special significance. Any hum voltages which reach the loudspeaker will be reproduced to a considerably greater degree than in the case of ordinary receivers having only a limited bass response. Thus, it becomes quite important that every effort be made to keep this hum at an absolute minimum. The several possibilities for hum pickup are treated in these notes. When customer complaints of an excessive hum level are experienced the following corrective measures are suggested. If the service man does not have an adequate stock of parts to make the changes which may be required, the additional parts may be procured from the Service Department, Scott Radio Laboratories, Inc., 4541 N. Ravenswood Avenue, Chicago, Ill.

Before taking any corrective measures check the wiring of the power supply, particularly the receiver receptacle J-3, to make sure that it conforms fully with the circuit diagram.

CONDITIONS FOR ELECTRICAL HUM AND SUGGESTED MEASURES

A. Hum present when receiver is switched on but Volume Control is adjusted for minimum output.

Elimination of Defective Components

The first step in locating the cause of hum under these conditions is to remove the 3rd audio amplifier tube V-19 (6SL7GT, located in the power supply chassis). If the hum disappears or is greatly reduced the indicated fault lies in or ahead of this tube. If ahead of this tube it is, undoubtedly, caused by the 1st or 2nd audio amplifier tubes, V-9 (6J5) or V-10 (6J5), or their associated circuits located on the receiver chassis. If this source of hum is indicated, replace these tubes one at a time with a tube of known good quality, preferably one with a reversed coil heater which has the lowest hum pickup. If these tube replacements do not reduce the hum the 6L6 output tubes should also be replaced. If none of these tube replacements affect the hum the electrolytic capacitor C-33 which is used as a filter for the plate supply of the 1st and 2nd audio stages should be checked. It may be checked in a simple manner by bridging it temporarily with another 20 mfd., 300 to 450 volt rated capacitor, making certain that the correct polarity is observed.

If the hum is still present when the 3rd audio amplifier tube, V-19 (6SL7GT), is removed the fault may lie in a defective electrolytic filter capacitor in the high voltage supply, that is, C-93 or C-94. By shunting each capacitor with another unit of the same capacity and voltage rating, the defective unit can be easily located.

Also check the d.c. potential on each audio grid to determine whether it is excessive. A high d.c. voltage at any grid point indicates a leaky coupling condenser.

IMPROVEMENT OF FILTERING ACTION IN POWER SUPPLY

If the occasion arises where the above measures fail to improve the hum situation sufficiently to satisfy the customer, the only alternative is to provide additional filtering in the power supply. Such filtering may be essential in those localities where the A.C. power supply has a bad waveform. If the 60 cycle supply is distorted, the higher harmonics will appear particularly objectionable and may demand a greater degree of filtering. The circuit is arranged so that the additional choke serves to filter the entire supply and therfore, reduces hum from the output tubes as well as the other points of the audio amplifier. In the new arrangement two chokes part no. 17B492 are used instead of one as used in earlier layout. This additional filtering may be installed by relocating L-17 on the power supply chassis and mounting the second choke adjacent to it. The suggested arrangement and wiring diagram are shown on an attached sheet.

The following additional components are required for making this installation:

1 - Insulated wire - 4 1/4" long
1 - Single lug terminal - Part No. 90B711
1 - Filter choke - Part No. 17B492
4 - Screws - 8/32 x 3/8" long - Part No. 77A382
4 - Lockwashers - #8 - Part No. 95A251
4 - Nuts - #8 - Part No. 59A178
1 - Screw - 6/32 x 1/8" long - Part No. 77A202

The following steps may be taken for ease of installation: (Refer to Diagrams on Wiring and Schematic for Installation of Additional Filter Reactor - Model 800-B).

1. Remove 6/32 mounting screws of C-88 and R-82.
2. Remount terminal strip holding C-87 and R-80 under mounting foot of C-89.
3. Unsolder leads of L-17 and remove choke.
4. Remove one of the red leads of C-94 from #2 terminal point and connect this lead to the new single terminal point #3.
5. Drill 11 holes.
   - 8 - Clearance holes, #22 drill, for choke mtg.
   - 1 - Tapped hole for 6/32 screw.
   - 2 - 3/8" clearance holes for choke leads.
6. Mount chokes (L-17 and additional one).
7. Mount C-88 using 1/8" 6/32 screw and one of the old 6/32 screws, securing the ground lug under the unit.

©John F. Rider

SCOTT RADIO LABS. INC.

8. Wire new yellow cathode lead from point #4, (the positive terminal) on C-88 to #6 pin on 6SL7 tube socket.

9. Wire short lead from 1st choke to #2 pin on 5Y3 socket. Wire long lead on 1st choke to #3 lug - also **short lead** from 2nd choke to **#3** lug

10. Wire long lead from 2nd choke to #2 terminal lug.

B. Excessive hum with Volume Control in an advanced position and receiver switched into "Phono" or "Television" position.

A considerable improvement in the higher pitched hum level will be realized by rearranging the wiring of the "phono" and "television" input circuits and the high level audio lead running to the volume control. These leads are placed in cables in the wiring of earlier receivers, and have to be routed separately and generally isolated from other circuits to achieve the desired result. However, to avoid excessive dismantling of the receiver in the field the leads now running in the cables should be cut off and may be left in the cable while additional isolated leads are connected between the points concerned.

The following additional components are required for making this installation:

3 - Cable Clamps	- Part No.	18A312
3 - Shielded leads	- Part No.	96B962
1 - Screw - 6/32 x 1/8" long	- Part No.	77A202
3 - Lockwashers - #6	- Part No.	95A255
2 - Screws - 6/32 x 5/16" long	- Part No.	77A374
2 - Spacers - 1 1/8"	- Part No.	84A211
2 - Screws - 5/40 x 1 3/4" long	- Part No.	77B957
1 - Single lug terminal	- Part No.	90B711
2 - Nuts - 6/32	- Part No.	59A177

The following steps should be taken:

1. Disconnect ground braids and wires leading to the "phono" and "television" terminals.
2. Disconnect the other ends of these two shielded leads from switch C-3.
3. Disconnect shielded lead from C-30 coupling condenser.
4. Disconnect shielded lead from the high potential terminal of the volume control.
5. Remove short spacers from switch C-3 and substitute long spacers and screws. Reassemble using all washers and lockwashers which were used previously.
6. Add terminal #1 to chassis, mounting it under one foot of condenser C-30, or if possible drill #22 hole under C-30 as this will make wiring simpler as per diagram.
7. Add shielded lead to connect from volume control to C-30, connecting shields together at the volume control. Route lead across chassis toward the bottom edge which adjoins the bottom plates. Fasten lead under new cables clamps instead of the ones used previously. Insert one cable clamp with a short mounting screw on the left side of the chassis near the treble control.
8. Do not ground shield braid at terminal of C-30. Connect it to the added ground terminal mounted under one foot of C-30. Use this point also for connecting shields of leads coming from "phono" and "television" terminals.
9. Add new shielded leads from "phono and "television" terminals. Connect shield braids of these leads to the "ground" terminals at these points, but do not make a connection between either of these "ground" terminals and the chassis. Route leads along the lower edge of the chassis to switch C-3 using a cable clamp, fastened under one foot of the bathtub condenser C-29 to secure the cable.

C. Hum present only when a station carrier is tuned in and volume advanced.

Hum present under these conditions is generally caused by a defective tube. The most common fault being found in the second detector V-6 (6H6) when AM signals are being received or the discriminator V-18 (6H6) when FM signals are being received. The fault can be easily corrected by replacing these tubes with tubes of known good quality preferably of the metal type.

In some cases hum may be induced into the receiver from the power line. This form of pickup can usually be eliminated by employing a good ground connection between the receiver chassis and a cold water pipe or a pipe driven into the ground. Do not attempt to use the house wiring conduit or BX as a ground connection. Such an arrangement usually results in increased noise or hum pickup.

CONDITIONS FOR VIBRATIONAL OR MECHANICAL HUM AND SUGGESTED REMEDIES

A. Receiver hums when power is switched off.

In the 800-B, push-button tuning is accomplished by means of a motor driven mechanism. The transformer supplying the power for the drive motor, FM-AM changeover relay and the "power on-off" relay, is connected to the power circuit at all times. Therefore, a mechanical vibration may be heard even though the receiver is switched off. This form of hum is caused by transformer laminations vibrating against the bottom cover plate of the power amplifier.

To remedy this condition, remove the bottom plate of the power supply and apply strips of masking or adhesive tape along the bottom edge of the transformer so that the bottom plate cannot make metal to metal contact with the transformer case. In some extreme cases it may be necessary to mount the power supply on sponge rubber strips or felt bumpers in order to entirely eliminate this trouble.

MODEL 800 B RADIO-PHONOGRAPH

CIRCUIT REVISION OF CHANGES OUTLINED IN SERVICE NOTES DATED AUGUST 9 1946

Further investigations of hum problems have revealed that additional steps can be taken if satisfactory hum level is not accomplished by changes recommended in previous Service Notes.

We wish to repeat that tubes are often the cause of hum. Here at the Laboratory individual tubes have developed excessive hum output after the sets passed all our tests. Therefore, be sure to select tubes having the lowest hum level by trying several 6J5 and 6SL7 tubes. Carry spare tubes with you when installing the set as some may go bad from jolting received during delivery. If the receiver has incorporated the changes covered in previous Service Notes the following additional steps may be taken:

(1) Check to determine whether the lead from muting relay K3 is connected to the 6SL7 grid pin No. 1 or the 6L6-V20 grid. If it is connected to the 6SL7 input grid, move it to the 6L6-V20 input grid. This change prevents hum in the relay lead from being amplified by the 6SL7 tube.

(2) To reduce hum to the lowest possible level the following steps may be taken:

CONTINUED NOTES ON REDUCTION OF HUM OUTPUT AND AUDIO NOISES

(a) Add a 5600 ohm resistor (our Part No. 70A50, or equivalent) to the bass control circuit between the yellow leads and their terminal of the control R46. This resistor may be supported by a single lug terminal strip (our Part No. 90B711 or equivalent.) which can be mounted by a screw and nut already available near the bass control. The new resistor will be designated by the symbol R94.

(b) Remove the direct ground lug connection from contact #2 of the 1st audio socket X9 and add a 6¼" insulated wire between the common connection of pins #1 and #2 on the 1st audio socket and the same points on the 2nd audio socket X10. This change simply grounds the 1st audio shield and filament at the 2nd audio socket instead of at the 1st audio socket.

(c) The 1st audio shielded grid lead may be shortened from 10½" to 7" and run directly across the sockets to the volume control, instead of routing it around the chassis.

(d) Dress R80 and C87 as far as possible from heater pin #7 of the 6SL7 socket to prevent hum pickup in these components.

(3) Check the wiring of capacitor (C34), 25 mfd 25 volt electrolytic condenser, to determine whether it is connected correctly The positive end of this capacitor should be connected to the cathode of the 6J5 and the negative end to the junction of R42 and R47 Some sets may have gone through our inspection with this capacitor wired backwards. An incorrect connection will not show initially on electrical tests, but some hum and noise may develop from it after a period of a few weeks operation.

Items Nos. 1 and 2 will be incorporated in sets numbering Serial 3,000 up to eliminate possible trouble from these sources.

C90	V19B plate to V21 grid coupling	Same as C35	
C91	V20, V21 cathode bypass	Capacitor, electrolytic, 25 MFD, 50 V DC wkg., paper tubular case, wire leads	15B638
C92	Audio output shunt	Capacitor, mica, 5000 MMF 20%, 1000 V DC wkg., bakelite case, tab terminals	15B763
C93	High voltage output filter	Capacitor, electrolytic, 30/30 MFD 450 V DC wkg., bakelite case 1 3/8" dia. x 3 1/2" long, 3 wire leads, black common, mounts by 3/4-16 threaded bushing	15B744
C94	Filter reactor output bypass	Same as C93	
C95	Filter reactor input bypass	Capacitor, paper, 4 MFD, 600 V DC wkg., metal can 1½" dia. x 4½" long, mounts by 3/4-16 threaded bushing, 2 lugs	15B481
C96	AC power input bypass	Same as C75	
C97	V19A input compensating	Capacitor, mica, 1000 MMF 10%, 500 V DC wkg., CM30 case, wire leads	15A35
	MISCELLANEOUS ELECTRICAL PARTS		
E1	AM-antenna terminal strip	Terminal strip, 3 terminals mounted on 3/4" W x 2" L bakelite strip, marked AM-ANT-GND	87B644
E2	FM-antenna terminal strip	Terminal strip, 3 terminals mounted on 3/4" W x 2" L bakelite strip, marked FM-ANT-GND	87B643
E3	BC Band ant. sec., L2 inductance adj.	Powdered iron core 5/16" dia. x 1/2" L, adj. screw 6-32 x 1" L slotted at end	24A99
E4	SW Band ant. sec., L4 inductance adj.	Powdered iron core 5/16" dia. x 1/2"L, adj. screw 6-32 x 1¼" L, slotted at end	24A98
E5	BC Band oscillator, L5 inductance adj.	Same as E3	
E6	SW Band oscillator, L6 inductance adj.	Same as E3	
E7	BC Band mixer, L7 inductance adj.	Same as E4	
E8	SW Band mixer, L8 inductance adj.	Same as E3	
E9	1st AM-IF primary inductance adj.	Same as E4	
E10	1st AM-IF secondary inductance adj.	Same as E4	
E11	2nd AM-IF primary inductance adj.	Same as E4	
E12	2nd AM-IF secondary inductance adj.	Same as E4	
E13	3rd AM-IF primary inductance adj.	Same as E4	
E14	FM antenna secondary inductance adj.	Powdered iron core .274"dia. x 9/16" L, adj. screw 6-32 x 1¼"L slotted at end, iron core insulated from screw	24B758
E15	FM oscillator inductance adj.	Same as E14	
E16	FM mixer secondary inductance adj.	Same as E14	
E17	1st FM-IF primary inductance adj.	Same as E3	
E18	Phono-input terminal strip	Terminal strip, 2 terminals mounted on 3/4" W x 2 1/8"L bakelite strip, marked PHONO-GND	87A220
E19	Television input terminal strip	Terminal strip, 2 terminals mounted on 3/4"W x 2 1/8" L bakelite strip, marked TELEV-GND	87B642
E20	1st FM-IF secondary inductance adj.	Same as E3	

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	MISCELLANEOUS ELECTRICAL PARTS (Continued)		
E21	2nd FM-IF primary inductance adj.	Same as E4	
E22	2nd FM-IF secondary inductance adj.	Same as E4	
E23	3rd FM-IF primary inductance adj.	Same as E4	
E24	3rd FM-IF secondary inductance adj.	Same as E4	
E25	4th FM-IF primary inductance adj.	Same as E4	
E26	4th FM-IF secondary inductance adj.	Same as E4	
E27	Pushbutton switch cable terminal board	Terminal strip with 12 solder lugs, 1" W x2 17/32" long bakelite strip	87B546A
E28	Dial drive motor	Motor, reversible type shaded pole, operates on 24 volts 50-60 CPS	58B447
E29	Dial pointer assembly	Dial indicator pointer with guide	29B749
E30	Dial calibration scale	Calibration scale on glass plate 4½" x 11 7/32"	29B637
E31	Control knob	Plastic knob 1 1/8" dia. black with red arrow 1/4" bushing, 8-32 set screw	47B659
E32	Main tuning knob	Plastic knob 2" dia. Polished chrome finish ¼" bushing - 8-32 set screw	47B660
E33	Pushbutton	Clear plastic pushbutton 11/16" sq. with slot for station indicator tab, fits .050 x .312 flat shaft	10B735
E34	Knob set screw wrench	Wrench for #8 hollow head set screws 5/64" hex x 1 7/8" long	94B810
E35	Backplate rotor disk insulator strip	Strip, bakelite 27/32" x 9/16" x 3/16" with .040 W x .058 H, rib in center	87B560
E36	Backplate rotor disk assembly	Rotor disk assembly for pushbutton tuning system backplate	2B890
E37	Backplate contact assembly (long bracket)	Contact assembly for pushbutton tuning system backplate - long bracket	8B503A
E38	Backplate contact assembly(short bracket)	Contact assembly for pushbutton tuning system backplate - short bracket	8B504A
E39	AM-RF resistor strip assembly	Strip, bakelite 6 lugs with resistors R1, R2 and R4	87B547B
E40	Converter channel resistor strip assembly	Strip, bakelite 6 lugs with resistors R8, R11 and R12	87B547C
E41	AM-IF resistor strip assembly	Strip, bakelite 12 lugs with resistors R22, R17, R23, R19, R18 and R13	87B546C
E42	AM diode resistor strip assembly	Strip, bakelite 12 lugs with resistors R36, R33, R32, R34, R35 and R16	87B546B
E43	1st audio amp. resistor strip assembly	Strip, bakelite 6 lug with resistors R40, R39 and R38	87B547D
E44	2nd audio amp. resistor strip assembly	Strip, bakelite 12 lugs with resistors R44, R43, R42, R41 and R47	87B546D
E45	1st FM-IF resistor strip assembly	Strip, bakelite 6 lugs with resistors R59, R6 and R F choke L15	87B547E
E46	2nd FM-IF resistor strip assembly	Strip, bakelite 6 lugs with resistors R63, R64 and R65	87B547F
	FUSES		
F1	Power transformer primary fuse	Fuse, miniature cartridge, 3A, 250 V, 1/4" dia. x 1¼"L Type 3AG	37A162
F2	Pushbutton tuning transformer primary fuse	Fuse, miniature cartridge, 1A, 250 V, ¼" dia. x 1¼" L Type 3AG	37B655
	DIAL LAMPS		
I1	Dial lighting lamp	Lamp, miniature bayonet base, 6-8 V @ .150 amp. #47, brown bead	49A168
I2	Dial lighting lamp	Same as I1	
I3	Phono indicator lamp	Same as I1	
I4	BC Band indicator lamp	Same as I1	
I5	SW Band indicator lamp	Same as I1	
I6	FM Band indicator lamp	Same as I1	
	JACKS & RECEPTACLES		
J1	Record changer power receptacle	2 contact female plug with metal shield cap and cable clamp	65B840
J2	Speaker receptacle	10 contact female receptacle, 11/16" W x 1 9/16"L H.B.Jones type S-310-AB	67B542
J3	Receiver power receptacle	12 contact female receptacle, 15/16" W x 1¼" L, H.B.Jones type S-312-AB	67B541

SCOTT RADIO LABS. INC.

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	JACKS & RECEPTACLES (Continued)		
J4	Audio input receptacle	4 contact female receptacle 11/16" W x 3/4" L, H. B. Jones type S-304-AB	67B543
J5	FM-IF input receptacle	Single contact female receptacle, mounts in 5/8"dia. hole, Amphenol type 80C Used on early model sets	67B634
J5	FM-IF input receptacle	Receptacle, 2 contact female mounts in 5/8" dia. hole, type PC2F. Used on late model sets	67B960
J6	Remote keyboard receptacle	21 contact female receptacle 1" W x 2¼" L, H.B. Jones type S-321-AB	67B786
J7	Loop antenna receptacle	4 contact female receptacle 13/16" W x 1½" L	67B645
	RELAYS		
K1	FM-AM changeover relay	Relay, 2 position with 2 rotary type wafer switches SW6A and SW6B, 2 coils L18 and L19, operates on 10 V AC. Used before Serial 2000	69B733
K1	FM-AM changeover relay	Relay, 2 position with 2 rotary type wafer switches SW6A and SW6B, 2 coils L18 and L19, operates on 24 V AC. Used after Serial 2000	69B983
K2	AC power ON-OFF relay	Relay, 2 position with 1 rotary switch section SW5, 2 coils L20 and L21, operates on 24 V AC. Used before Serial 2000	69B734
K2	AC power ON-OFF relay	Relay, 2 position with 1 rotary switch section SW5, 2 coils L20 and L21, operates on 22 V AC. Used after Serial 2000	69B984
K3	Audio muting relay	Relay, S.P.S.T. contacts normally open operates on 2.4 V AC	69B507
K4	Relay for dial drive motor	Same as K3. Added after Serial 2000	
K5	Relay for dial drive motor	Same as K3. Added after Serial 2000	
	INDUCTORS & CHOKES		
L1	BC Band antenna primary coil	RF inductor, universal wound on 1" dia. x 7/8" L form	20B604
L2	BC Band antenna secondary coil	RF inductor, universal progressive wound on 1" dia. x 1¾" L form, adjustable iron core	20B605
L3	SW Band antenna primary coil	RF inductor, solenoid wound on 3/4" dia. x 7/8"L form	20B608
L4	SW Band antenna secondary coil	RF inductor, solenoid wound on 3/4" dia. x 1¾" L form, adjustable iron core	20B609
L5	BC Band oscillator coil	RF inductor, solenoid wound on 1" dia. x 2¼" L form, adjustable iron core	20B607
L6	SW Band oscillator coil	RF inductor, solenoid wound on 3/4" dia. x 2¼" L form, adjustable iron core	20B611
L7	BC Band mixer coil	RF transformer, primary universal wound, secondary progressive universal wound on 1" dia. x 2¼" L form, adjustable iron core	20B606
L8	SW Band mixer coil	RF transformer, primary and secondary solenoid wound on 3/4" dia. x 2¼" L form, adjustable iron core	20B610
L9	FM antenna coil	RF transformer, primary and secondary solenoid wound on ⅜" dia. x 2 1/8" L form, adjustable iron core	20B612
L10	FM oscillator coil	RF inductor, solenoid wound on ⅜" dia. x 2 1/8" L form, adjustable iron core	20B614
L11	FM mixer coil	RF transformer, primary and secondary solenoid wound on ⅜" dia. x 2 1/8" L form, adjustable iron core	20B613
L12	1st FM-IF primary coil	RF inductor, solenoid wound on ⅜" dia. x 2 1/8" L form, adjustable iron core	20B618
L13	1st FM-IF secondary coil	RF inductor, solenoid wound on 7/16" dia. x 1 3/8" L form, adjustable iron core	20B619
L14	Bass boost choke	Audio reactor, 11 H @ 1000 CPS, no DC, laminated iron core, potted	17B591
L15	V14 plate filter choke	RF choke, 40 T #26 SSE wire on 9/32" dia. x 7/8" L form wire leads	17B761

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	INDUCTORS AND CHOKES (Continued)		
L16	FM discriminator audio filter	Same as L15	
L17	High voltage filter choke	Filter reactor, 5 H @ 200 MA DC, laminated iron core, potted in chrome plated case	17B492
L18	FM-AM relay coil	Relay coil, wound on insulated copper sleeve, two terminals, 425 T #24 E wire DC resistance 2 ohm or 350 T #22 E wire, DC resistance 1 ohm, operates on 10 volts 60 CPS. Used on receivers before Serial 2000	20B707
L19	FM-AM relay coil	Same as L18	20B707
*L18	FM-AM relay coil	Relay coil, wound on insulated copper sleeve, two terminals, 800 T #30 E wire DC resistance 13 ohms, operates on 24 volts 60 CPS Used on receivers after Serial 2000	20B932
*L19	FM-AM relay coil	Same as L18	20B932
L20	AC power ON-OFF relay coil	Relay coil wound on insulated copper sleeve, two terminals, 1200 T #28 E wire, DC resistance 20 ohms or 1100 T #29 E wire, DC resistance 16 ohms, operates on 24 volts 60 CPS. Used on receivers before Serial 2000	20B719
L21	AC power ON-OFF relay coil	Same as L20	20B719
*L20	AC power ON-OFF relay coil	Relay coil wound on insulated copper sleeve, two terminals, 900 T #32 E wire, DC resistance 23 ohms operates on 24 volts, 60 CPS. Used on receivers after Serial 2000	20B977
*L21	AC power ON-OFF relay coil	Same as L20	20B977
L22	Muting relay coil	Audio muting relay coil, part of K3 assembly, operates on 2.4 volts 60 CPS	
L23	Drive motor relay coil	Same as L22. See relay K4	
L24	Drive motor relay coil	Same as L22. See relay K5	
L25	High voltage filter choke	Same as L17	
	LOUDSPEAKERS		
LS1	Loudspeaker for 800-B	Loudspeaker, coaxial type, 15 inch low frequency with 5 inch PM tweeter mounted axially, complete with crossover network and cable with 10 contact plug P-310-CCT. Field for 15 inch speaker 675 ohms series and 9000 ohms shunt. Input impedance 8 ohms	85B490
LS2	Loudspeaker for 800-B	Loudspeaker, 15" dynamic extended range. Field 675 ohm series and 9000 ohms shunt. Input impedance 16 ohms	85B909
	PLUGS		
P1	Receiver chassis power plug	Plug, 12 contact, male, metal cover with cable clamp, Type P-312-CCT	65A184
P2	Receiver chassis audio plug	Plug, 4 contact, male, metal cover with cable clamp, Type P-304-CCT complete with 4 wire cable	96B677
P3	FM-IF input plug	Plug, single contact, male Type 80M. Used on early model sets	65B656
P3	FM-IF input plug	Plug, 2 contact, male, Type MC2M. Used on later model sets	65B959
P4	Loudspeaker plug	Plug, 10 contact, male, metal cover with cable clamp, Type P-310-CCT	65A186
P5	AC power input plug	Plug, 2 contact, male, plastic shell	65B679
	RESISTORS		
R1	V1 - AM-RF grid return	Resistor, composition, .47 meg 10%, ½ watt, wire leads	70A61
R2	V1 - cathode bias	Resistor, composition, 560 ohms 10%, ½ watt, wire leads	70A46
R3	V1 - screen bleeder	Resistor, composition, 10,000 ohms 10%, ½ watt, wire leads	70A419

* These coils used on FM-AM and AC relays after Serial 2000.

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	RESISTORS (Continued)		
R4	V1 - Screen filter	Resistor, composition, 15,000 ohms 10%, 2 watt, wire leads	70B818
R5	Sensitivity control	Potentiometer, wire wound, 10,000 ohms 10%, 2 watt, linear taper, shaft: ¼" dia. x 3" L, complete with SPDT switch SW4 for N.L. circuit	70B569
R6	V2 - AM osc. grid leak	Resistor, composition, 47,000 ohms 10% ½ watt, wire leads	70A54
R7	V2 plate filter	Resistor, composition, 5100 ohms 10%, 1 watt, wire leads	70B648
R8	V3 - AM mixer grid return	Same as R1	
R9	V3 - injector grid return	Resistor, composition, 20,000 ohms 5%, ½ watt, wire leads	70A52
R10	V3 cathode bias	Resistor, composition, 240 ohms 5%, ½ watt, wire leads	70A45
R11	V1 - RF amp. plate filter	Resistor, composition, 1000 ohms 10%, ½ watt, wire leads	70A47
R12	V3 screen filter	Resistor, composition, 18,000 ohms 10%, 2 watt, wire leads	70A68
R13	V3 plate filter	Same as R11	
R14	1st AM-IF secondary series	Resistor, composition, 47 ohms 10%,½ watt, wire leads	70A420
R15	1st AM-IF secondary series	Resistor, composition, 10 ohms 10%,½ watt, wire leads	70A42
R16	V4 - 1st AM-IF amp. grid return	Resistor, composition, .22 meg 10%, ½ watt, wire leads	70A59
R17	V4 cathode bias	Same as R2	
R18	V4 screen filter	Resistor, composition, .1 meg 10%, ½ watt, wire leads	70A58
R19	V4 plate filter	Same as R11	
R20	2nd AM-IF secondary series	Same as R14	
R21	2nd AM-IF secondary series	Same as R14	
R22	V5 - 2nd AM-IF amp. cathode bias	Same as R2	
R23	V5 screen filter	Same as R18	
R24	V5 plate filter	Same as R11	
R25	AM tuning eye target series	Resistor, composition, 1 meg 20%, ½ watt, wire leads	70A63
R26	V11 - FM-RF amp. grid series	Resistor, composition, 5 ohms 10%,½ watt, wire leads	70B860
R27	Not used		
R28	V8 FM tuning eye grid return	Same as R1	
R29	V8 FM tuning eye adj.	Potentiometer, composition, 1 meg 20%, .4 watt, shaft: ¼" dia. x 11/32" L, screwdriver slot adj. linear taper	70B568
R30	V8 FM tuning eye target series	Same as R25	
R31	AM diode load	Same as R6	
R32	AM diode filter	Same as R6	
R33	V6 noise limiter cathode filter	Resistor, composition, .82 meg 10%,½ watt, wire leads	70B649
R34	AVC line filter	Same as R33	
R35	V7 AM tuning eye filter	Resistor, composition, 2.2 meg 20%,½ watt,wire leads	70A64
R36	V6 noise limiter cathode bias	Same as R33	
R37	Volume control	Potentiometer, composition, 1 meg 20%, .4 watt, clockwise audio taper, shaft: ¼" dia. x 3" long	70B570
R38	V9 1st AF amp. cathode bias	Resistor, composition, 1300 ohms 5%, ½ watt, wire leads	70B650
R39	V9 plate load	Same as R6	
R40	V9 plate filter	Same as R6	
R41	V10 2nd AF amp. grid return	Same as R18	
R42	V10 cathode bias	Same as R38	
R43	V10 plate load	Same as R6	
R44	V10 plate filter	Same as R6	
R45	Treble control	Potentiometer, composition, .25 meg 20%, .4 watt,clockwise audio taper, tapped at .125 meg 20%, shaft: ¼" dia. x 3" L.	70B540
R46	Bass control	Same as R45	
R47	Tone control circuit return	Same as R3	
R48	V11 FM-RF amp. cathode bias	Resistor, composition, 150 ohms 10%, ½ watt,wire leads	70A44
R49	V11 screen filter	Resistor, composition, 56,000 ohms 10%, ½ watt, wire leads	70A55
R50	V12 FM oscillator grid return	Same as R18	
R51	V11 plate filter	Same as R11	
R52	V12 plate filter	Same as R7	

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	RESISTORS (Continued)		
R53	V13 FM mixer grid series	Same as R26	
R54	V13 cathode bias	Same as R11	
R55	V13 screen filter	Same as R16	
R56	V13 plate filter	Resistor, composition, 2400 ohms 5%, ½ watt, wire leads	70A49
R57	V14 1st FM-IF amp. grid series	Resistor, composition, 56 ohms 10%,½ watt, wire leads	70A43
R58	V14 cathode bias	Resistor, composition, 160 ohms 5%, ½ watt, wire leads	70B654
R59	V14 screen filter	Same as R49	
R60	V14 plate filter	Same as R56	
R61	T4 secondary shunt	Resistor, composition, 27,000 ohms 10%, ½ watt, wire leads	70A418
R62	V15 2nd FM-IF amp. grid series	Same as R57	
R63	V15 cathode bias	Same as R58	
R64	V15 screen filter	Same as R49	
R65	V15 plate filter	Same as R56	
R66	T5 secondary shunt	Same as R6	
R67	V16 1st FM limiter grid series	Resistor, composition, 27 ohms 10%,½ watt, wire leads	70B666
R68	V16 plate and screen filter	Resistor, composition, 39,000 ohms 10%, 1 watt, wire leads	70B653
R69	V8 FM tuning eye grid filter	Same as R35	
R70	V17 2nd FM limiter grid series	Same as R67	
R71	V17 grid leak	Same as R61	
R72	V17 grid return filter	Resistor, composition, 15,000 ohms 10%, ½ watt, wire leads	70A51
R73	V17 screen bleeder	Resistor, composition, 15,000 ohms 10%, 1 watt, wire leads	70B683
R74	V17 screen filter	Same as R68	
R75	V17 plate filter	Same as R18	
R76	V18 FM discriminator filter	Same as R49	
R77	V18 diode load	Same as R18	
R78	V18 diode load	Same as R18	
R79	FM de-emphasis network	Same as R6	
R80	V19A grid series	Same as R1	
R81	V19A grid return	Same as R6	
R82	V19A, V19B cathode bias	Resistor, composition, 1500 ohms 10%,½ watt,wire leads	70A48
R83	V19B plate load	Same as R16	
R84	V19A plate load	Same as R16	
R85	V20 grid return	Same as R16	
R86	V21 grid return	Same as R16	
R87	V19B grid return	Same as R16	
R88	V20,V21 cathode bias	Resistor, wirewound, 250 ohms 5%, 10 watt, vitreous enamel, wire leads	70A70
R89	V20 plate to V19A plate feedback	Same as R25	
R90	Audio output filter	Resistor, wirewound, 10,000 ohms 10%, 10 watt, vitreous enamel, wire leads	70B760
R91	V22 anode, dropping resistor	Resistor, wirewound, 3000 ohms 10%, 10 watt, vitreous enamel, wire leads	70B681
R92	Receiver high voltage dropping resistor	Resistor, wirewound, 300 ohms 10%, 10 watt, vitreous enamel, wire leads	70B682
R93	Speaker series field dropping resistor	Same as R91	
	SWITCHES		
SW1	Loop antenna switch	Switch, rotary, D.P.D.T., shaft: ¼" dia. x 11/32"long screwdriver slot	89B628
SW2	AM Band change switch	Switch, 4 section rotary, 2 position indent, front shaft ¼" x 2 13/16" long, shaft at rear 1½" long, ¼" dia. flat on 2 sides	89B508
SW2A	Antenna channel switch section	Switch section, 2 pole, 2 position, bakelite wafer, rotary type	89B508-2
SW2B	Oscillator channel switch section	Same as SW2A	
SW2C	Mixer channel switch section	Same as SW2A	
SW2D	Indicator lamp switch section	Switch section, 3 pole, 2 position, bakelite wafer, rotary type	89B508-1
SW3	Selectivity switch	Switch, 4 section rotary, 5 position indent, front shaft ¼" dia. x 2 13/16" long, shaft at rear 1¼" long, ¼" dia. flat on two sides	89B509
SW3A	1st AM-IF Switch section	Switch section, 2 pole, 5 position, rotary type, bakelite wafer	89B509-1
SW3B	2nd AM-IF switch section	Same as SW3A

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	SWITCHES (Continued)		
SW3C	Phono-Radio switch section	Same as SW3A	
SW3D	Indicator lamp switch section	Same as SW3A	
SW4	Noise limiter switch	Switch, S.P.D.T. mounted on rear of sensitivity control R5, throws at maximum rotation of control	
SW5	AC power relay switch section	Switch section, 3 pole, 2 position, rotary type, bakelite wafer	89B626-1
SW6A	FM-AM relay switch top section	Switch section, 4 pole, 2 position, rotary type, bakelite wafer	89B625-1
SW6B	FM-AM relay switch bottom section	Switch section, 2 pole, 2 position, rotary type, bakelite wafer	89B625-2
SW7	Muting relay switch	Switch, S.P.S.T. mounted on relay K3	
SW8	Pushbutton switch gang	Switch, gang consisting of 7, S.P.S.T. momentary contact switches actuated by push levers	89B478
SW9	Pushbutton switch gang	Same as SW8	
SW10	Drive motor relay switch	Same as SW7. See relay K4	
SW11	Drive motor relay switch	Same as SW7. See relay K5	
	TRANSFORMERS, RF, AUDIO, POWER		
T1	1st AM-IF transformer	IF transformer, 455 KC, adjustable iron cores on primary and secondary	20B615
T2	2nd AM-IF transformer	IF transformer, 455 KC, adjustable iron cores on primary and secondary	20B616
T3	3rd AM-IF transformer	IF transformer, 455 KC, adjustable iron core on primary, secondary untuned	20B617
T4	2nd FM-IF transformer	IF transformer, 10.7 MC adjustable iron cores on primary and secondary	20B620
T5	3rd FM-IF transformer	IF transformer, 10.7 MC adjustable iron cores on primary and secondary	20B621
T6	4th FM-IF transformer	IF transformer, 10.7 MC adjustable iron cores on primary and secondary	20B622
T7	FM discriminator transformer	IF transformer, 10.7 MC, primary and secondary tuned by variable air trimmers	20B623
T8	Audio output transformer	Output transformer, primary 9000 ohms @ 1000 CPS, 100 MA DC, secondary 16 ohms tapped at 8 ohms, 25 watts	91B664
T9	Power transformer	Transformer, primary 120 V 50-60 CPS. Sec. 1-5 V @ 4A. Sec.-2-390-390 V @ 210 MA. Sec. 3-6.3 V @ 4 A. Sec. 4 6.6 V @ 4.6 A. Electrostatic shield between primary and secondaries	91B429
T10	Pushbutton tuning system transformer	Transformer, primary 117 volts 50-60 CPS. Sec. 46 V @ 2.5 A, tapped at 36 V and 24 V, primary designed for intermittent duty	91B694
	VACUUM TUBES		
V1	AM-RF amplifier	Vacuum tube, 6SK7, octal base, remote cutoff pentode Heater: 6.3 V @ .3 amp	92A225
V2	AM oscillator	Vacuum tube, 6J5, octal base triode, Heater: 6.3 V @ .3 amp	92A223
V3	AM mixer	Vacuum tube, 6SA7, octal base, pentagrid converter, Heater: 6.3 V @ .3 amp	92A227
V4	1st AM-IF amp.	Same as V1	
V5	2nd AM-IF amp.	Same as V1	
V6	AM 2nd detector AVC, noise limiter	Vacuum tube, 6H6, octal base, twin diode, Heater: 6.3 V @ .3 amp.	92A229
V7	AM tuning indicator	Vacuum tube, 6E5, 6 prong base, cathode ray indicator, Heater: 6.3 V @.3 amp	92B479
V8	FM tuning indicator	Same as V7	
V9	1st audio amp.	Same as V2	
V10	2nd audio amp.	Same as V2	
V11	FM-RF amp.	Vacuum tube, 6AG5, miniature type, RF amplifier pentode, Heater: 6.3 V @ .3 amp	92B593
V12	FM oscillator	Vacuum tube, 6C4, miniature type, H.F. triode, Heater: 6.3 V @ .15 amp	92B597
V13	FM mixer	Same as V11	

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	VACUUM TUBES (Continued)		
V14	1st FM-IF amp.	Vacuum tube, 6AC7, octal base, amplifier pentode, Heater: 6.3 V @ .45 amp	92A235
V15	2nd FM-IF amp.	Same as V14	
V16	1st FM-IF limiter	Vacuum tube, 6SJ7, octal base, sharp cutoff pentode, Heater: 6.3 V @ .3 amp	92A236
V17	2nd FM-IF limiter	Same as V16	
V18	FM discriminator	Same as V6	
V19	3rd audio amp. Phase inverter	Vacuum tube, 6SL7GT, octal base, twin triode, Heater: 6.3 V @ .3 amp	92B669
V20	Power output audio amp.	Vacuum tube, 6L6G, octal base, beam power amp., Heater: 6.3 V @ .9 amp	92A233
V21	Power output audio amp.	Same as V20	
V22	Voltage regulator	Vacuum tube, OD3-VR150/30, octal base, glow discharge voltage regulator	92A237
V23	High voltage rectifier	Vacuum tube, 5Y3GT, octal base, full wave high vacuum rectifier, filament 5 V @ 2 amp	92B[illegible]
V24	High voltage rectifier	Same as V23	
	WIRES AND CABLES		
W1	FM-IF lead	Shielded lead consisting of 7 ft RG58/u concentric line with single contact plug P3 type 80M attached. Used on early model sets.	65B656A
W1	FM-IF lead	Same as W1 above except plug is 2 contact type MC2M	65B959A
W2	Receiver power cable	Cable, 12 conductor, 2 shielded, with 12 contact plug P-312-CCT attached	96B676
W3	Audio connecting cable	Cable, 4 conductor, 2 shielded, with 4 contact P-304-CCT plug attached	96B677
	SOCKETS		
X1	Socket for V1	Socket, 8 contact octal, black bakelite type MIP-8, marked 6SK7	82B431
X2	Socket for V2	Socket, 8 contact octal, black bakelite type MIP-8, marked 6J5	82B433
X3	Socket for V3	Socket, 8 contact octal, black bakelite type MIP-8, marked 6SA7	82B432
X4	Socket for V4	Same as X1	
X5	Socket for V5	Same as X1	
X6	Socket for V6	Socket, 8 contact octal, black bakelite type MIP-8, marked 6H6	82B434
X7	Socket for V7	Socket, 6 contact, black bakelite PF-6 with metal cap	82B708
X8	Socket for V8	Same as X7	
X9	Socket for V9	Same as X2	
X10	Socket for V10	Same as X2	
X11	Socket for V11	Socket, 7 contact, miniature type with tube shield	82B663
X12	Socket for V12	Same as X11	
X13	Socket for V13	Same as X11	
X14	Socket for V14	Socket, 8 contact octal, black bakelite type MIP-8, marked 6AC7	82B438
X15	Socket for V15	Same as X14	
X16	Socket for V16	Socket, 8 contact octal, black bakelite type MIP-8, marked 6SJ7	82B439
X17	Socket for V17	Same as X16	
X18	Socket for V18	Same as X6	
X19	Socket for V19	Socket, 8 contact octal, black bakelite type MIP-8, marked 6SL7GT	82B687
X20	Socket for V20	Socket, 8 contact octal, black bakelite type MIP-8, marked 6L6G	82B436
X21	Socket for V21	Same as X2	
X22	Socket for V22	Socket, 8 contact octal, black bakelite type MIP-8, marked VR-150	82B440
X23	Socket for V23	Socket, 8 contact octal, black bakelite type MIP-8 marked 5Y3-GT	82B437
X24	Socket for V24	Same as X23

PART NO -26 SCHEMATIC	CHECKED BY LHC

MODEL 5S1-8

SEARLE AERO INDUSTRIES INC.

LIST OF MOST COMMON TROUBLES - SEARLE MOD.5S1-8 CLIPPER

A - SET DEAD

1. Tubes don't light up right.

IF nothing lights up - 6V6 Line Cord or Switch is open.

IF 150 OHM Resistor is too hot - 6SK7, 6SH7 or 6SL7 is open.

IF Tubes glow dull Red inside cathodes - Ballast is open or line cord resistor is open.

IF Tubes light too bright - Ballast or Line Cord is low.

2. If Tubes light up properly.

IF Voltage at V5 #8 is below 90 and Voltage is over 15 volt lower DN V4 #4 Circuit is shorted probably if trans or filter condenser.

IF Voltage is below 90 at V5 #8 and Voltage at V4 #4 is nearly same 6V6 rectifier is bad.

IF Voltage is low with hum Filter condenser is bad.

IF Voltages to above points are OK Check to V1 #6 and #8 V2 #6 and #8 - Low V on #6 pins - bad solder, Low V on #8 pins - bad IF Trans.

IF Set hums when finger is touched to hot side of pot Audio is OK.

IF Set is still dead, try new 6SL7 and 6SH7 then K7.

IF 456 KC comes through with tuning cond. open but not when closed - condenser is shorted.

IF A.V.C. is shorted to ground 1st IF trans. is shorted.

IF Set plays good, test OKsbut hums little try new 6SL7.

INDICATES GROUND TO CHASSIS BASE
AUGUST 15. 1946
FLOATING GROUND
SW.
TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO FLOATING GROUND AND ARE TAKEN WITH NO SIGNAL. A.C LINE VOLTAGE AT 117 VOLTS. WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ.
132.818
CODE
MEG=MEGOHM
K =1000 OHM

PRELIMINARY:

Output meter connection	Across loud speaker voice coil
Output meter reading to indicate 200 milliwatts	.8 volts
Connection of generator ground lead	Floating ground
Generator Modulation	30%, 400 cycles
Position of Volume Control	Fully clockwise
Position of Dial Pointer with Variable fully closed	54 on dial

POSITION OF VARIABLE	FREQUENCY GENERATOR	DUMMY ANTENNA	GENERATOR CONNECTION (high)	TRIMMERS ADJUSTED (In order shown)	TRIMMER FUNCTION
Open	455 kc.	.05 mfd.	12SA7GT grid	Top of T3	IF
1400 kc.	1400 kc.	.00005 mfd.	**Ant.	*C2	Osc.
600 kc.	600 kc.	.00005 mfd.	**Ant.	Check point	----

IMPORTANT ALIGNMENT NOTES

*Since the antenna stator section of the variable has no trimmer, the rotor is rocked back and forth while adjusting oscillator trimmer, to obtain maximum output.

Check the sensitivity at 600 kc, if weak adjust antenna section plates for maximum output at 600 kc, tracking is accomplished by adjusting plates of rotor.

**Unsolder 20' antenna lead from lug on antenna coil, and connect signal generator lead to lug through .00005 uuf Dummy Antenna.

Approximate stage by stage sensitivities are: Mixer - 455 kc - 2600 uv; Mixer 1000 kc - 2600 uv; Antenna - 1000 kc - 180 uv.

Power Supply -- 105-125 Volts AC-DC, 35 Watts
Power Output
Undistorted .8 Watts, Maximum - 2.5 Watts

Tuning Range Broadcast Band 540-1600 Kc
Speaker
Voice Coil Impedance 3.2 Ohms

GENERAL INFORMATION & SERVICE HINTS

Due to a wide variation in characteristics of 12SA7 tubes the set may have a tendency to oscillate when tube replacements are made. A 1 megohm resistor placed across the I F coil from B- to plate will usually correct this condition. Some sets already have this resistor installed.

1500 kc	1500 kc	* * *	T2, T1	Osc., R. F.

See Note Below

IMPORTANT ALIGNMENT NOTES

It is advisable to repeat the entire alignment procedure in the original order to insure greater accuracy.

Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

***Run a wire from the output terminal of the generator near the receiver. However, no connection is made between the signal generator and the receiver.

DIAL LAMP:

A six volt bayonet dial lamp No. 47 is used in this receiver. The dial lamp may be removed for replacement by gently squeezing the dial lamp socket mounting bracket and withdrawing from the dial assembly. Replace the lamp with another of the same type. DISCONNECT THE RECEIVER FROM THE ELECTRICAL OUTLET BEFORE REPLACING THE LAMP.

©John F. Rider

ALIGNMENT PROCEDURE

Output meter connections.....Across voice coil (3.2 ohms)
Output meter reading for 1/2 watt output.....1.25 volts
Connection of generator ground.....to chassis
Generator modulation.....Approx. 30% at 400 cycles
Position of volume control.....Full clockwise
Position of tone control.....High (In)
Position of dial pointer with variable cond. fully closed.....First mark to left of "55" on dial scale

POSITION OF DIAL POINTER	GENERATOR FREQUENCY	GENERATOR CONNECTION	DUMMY ANTENNA	TRIMMERS ADJUSTED IN ORDER SHOWN	TRIMMER FUNCTION
540 kc	455 kc	6SA7GT Grid	.1 μfd	C25, C24, C23, C22	I.F.
High end of scale	1720 kc	Radiated Signal		C21	Osc.
1500 kc	1500 kc	Radiated Signal		C19	Ant.

The alignment procedure should be repeated stage by stage to obtain greatest accuracy. Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly so as to minimize the effect of the automatic volume control.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output Meter Connection.....Across loud speaker voice coil
Output meter reading to indicate 50 Milliwatts (Standard Output).....1.2 Volts
Generator ground lead connection.....Receiver chassis
Dummy Antenna value to be in series with generator output.....See chart below
Connection of generator output lead.....See chart below
Generator Modulation.....30%, 400 cycles
Position of Volume Control.....Fully on
Position of Tone Control.....Treble
Position of pointer with tuner fully closed.....Last line below 540 calibration mark

WAVE BAND SWITCH POSITION	POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	ADJUSTMENTS (IN ORDER SHOWN)	FUNCTION
BC	Closed	455 KC	.1 mfd.	7H7 Transl. grid	T2, T1	IF
BC	Open	1750 KC	.0002 mfd.	Ant. Terminal	C6	Oscillator
BC	1410	1410 KC	.0002 mfd.	Ant. Terminal	C5, C1	Ant.,Transl.
BC	600 (rock)	600 KC	.0002 mfd.	Ant. Terminal	C7	Padder
SW	Open	18.3 MC	400 ohms	Ant. Terminal	C10	Oscillator
SW	15 (rock)	15 MC	400 ohms	Ant. Terminal	C2	Transl.

IMPORTANT ALIGNMENT NOTES

The Alignment must be done in the order given.

The Antenna Alignment Procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

During alignment of the 'BC' Band Padder and the 'SW' Band Translator Trimmers, the Tuner should be rocked through resonance to assure alignment.

Power Output — Undistorted 3.6 Watts — Maximum 6.5 Watts

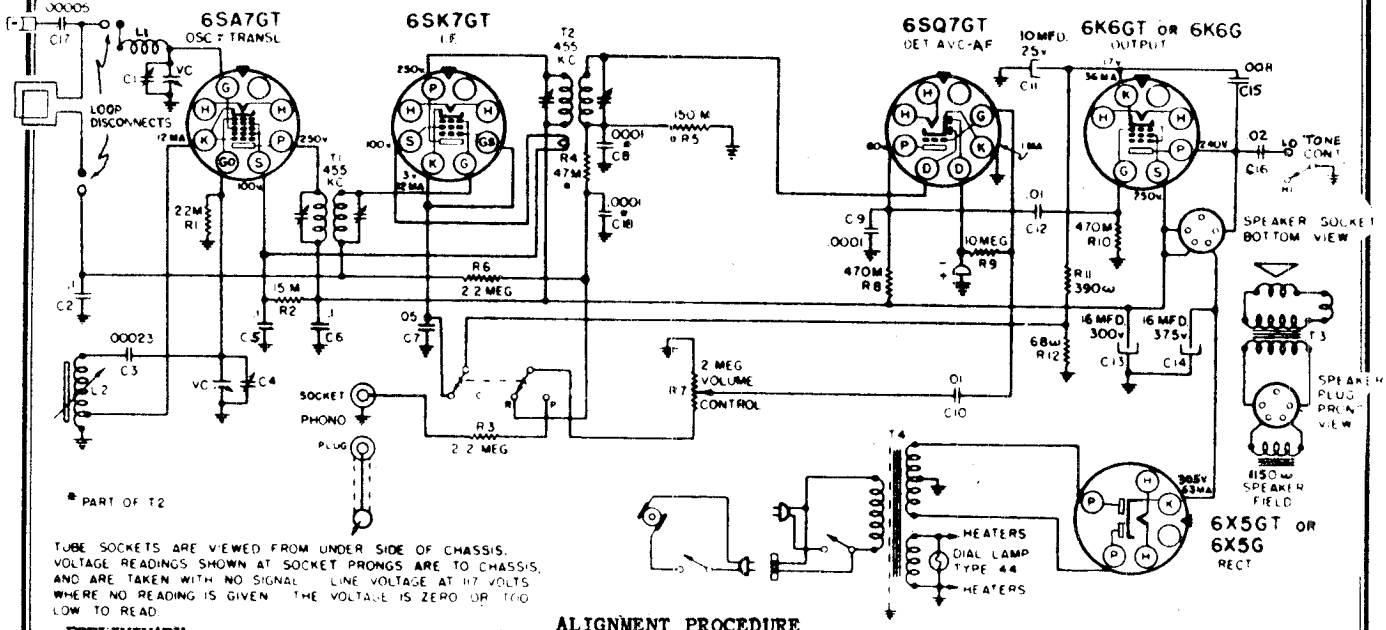
MODEL 6100, Ch. 101.660-1A

SEARS ROEBUCK & CO.



TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO CHASSIS, AND ARE TAKEN WITH NO SIGNAL. LINE VOLTAGE AT 117 VOLTS WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection.....Across loudspeaker voice coil
Output meter reading to indicate 500 milliwatts.....1.25 volts
Dummy antenna value to be in series with generator output.....See chart below
Connection of generator output lead.....See chart below
Connection of generator ground lead.....Receiver chassis
Generator modulation.....30%, 400 cycles
Position of Volume Control.....Fully clockwise
Position of Tone Control.....Counterclockwise (HI)
Position of Dial Pointer with variable fully closed.....On mark below 540 Kc Calibration mark

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	ADJUSTMENTS (IN ORDER SHOWN)	FUNCTION
Closed	455 Kc	.1 mfd.	6SA7 Grid	T2, T1	I.F.
Fully open	1620 Kc	.00005 mfd.	Ant. Clip	C4	Oscillator
1410 Kc	1410 Kc	.00005 mfd.	Ant. Clip	C1	Translator
600 Kc (rock)	600 Kc	.00005 mfd.	Ant. Clip	L2	Padder
Fully open	1620 Kc	.00005 mfd.	Ant. Clip	C4	Oscillator

IMPORTANT ALIGNMENT NOTES

Where indicated by the word "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

POWER OUTPUT Undistorted.....2.5 watts Maximum.....6 watts

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection.....Across loud speaker voice coil
Output meter reading to indicate 50 milliwatts (standard output).....0.4 Volts
Generator ground lead connection.....Receiver chassis
Dummy antenna value to be in series with generator output.....See chart below
Connection of generator output lead.....See chart below
Generator Modulation.....30%, 400 cycles
Position of Volume Control.....Fully on (Clockwise)
Position of Tone Control.....Hi (Counter-clockwise)
Position of dial pointer with tuner fully closed.....Last line to the left of the 540 Kc. calibration mark

Last line to the right of the 1700 Kc. calibration mark shall be considered 1725 Kc.

BAND SWITCH POSITION	POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	ADJUSTMENTS (IN ORDER SHOWN)	FUNCTION
BC	Closed	455 Kc	0.1 mfd.	1LC6 Transl. Grid	T2, T1	IF

9 Mc	9.6	9.6 Mc	400 ohms	Ant. Terminal	C3, C10	Ant., RF

IMPORTANT ALIGNMENT NOTES

Before attempting short-wave alignment the L5 core should be adjusted to a dimension of approximately 1-21/32" from the top core to the top turn of the winding. This should be done with the tuner in the 1725 Kc. position.

During alignment of the Antenna and RF trimmers on the shortwave spread bands the tuner should be rocked through resonance to assure alignment.

The alignment must be done in the order given. Adjust all trimmers and cores for maximum output.

The antenna alignment procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power rrom the generator at its lowest possible value to prevent the AVC action of the receiver from interfering with accurate alignment.

Power Output — Undistorted 0.125 Watts — Maximum 0.250 Watts

MODEL 6685
Ch.139.150

SEARS ROEBUCK & CO.

Power Shifter

"A" SUPPLY

The "A" supply is obtained from a full wave copper sulphide rectifier filtered by a condenser input filter consisting of three condensers and two low resistance chokes. A tap on the power transformer allows the voltage on the rectifier to be changed giving two "A" load voltages. Terminal voltages for various loads are indicated on the wiring diagram.

"B" SUPPLY

The "B" supply employs a 6J5GT tube operated as a half wave rectifier operating into a condenser input filter of one choke followed by another condenser.

The "A" and "B" circuits are not common to each other or to the chassis. Different tube biasing methods make this necessary.

POWER DRAIN

When the "A" voltage is excessively low the rectifier, condensers or transformer may be defective. To check the transformer remove one lead of transformer winding from the rectifier and measure for A.C. voltage indicated on the wiring diagram. To check the rectifier remove the plus lead from the choke L2 and condenser C2. Also disconnect one side of jumper wire and measure D.C. voltage across the rectifier. This should be 1.4 to 1.5 volts with the tap changer tie block in the 4-5 tube position.

"B" SUPPLY FAILS

The 6J5GT tube should be tested with a standard tube tester. The transformer may be tested by measuring the A.C. voltage across the secondary plate winding with the tube removed.

EXCESSIVE HUM

When excessive hum is noticed in the radio it may be due to the "A" supply or the "B" supply. The hum will be very loud when the input condenser C2 opens in service and this open condenser will cause the output voltage to drop to 1.35 volts without load (4-5 tube position). The hum will be somewhat less in volume if the second section or output condenser has opened and this will not change the output voltage.

When the hum is caused by the "B" supply, the condensers of this filter circuit have probably opened. If the input condenser has opened the output voltage will drop to approximately 110 volts without load. Less hum is caused when the output condenser opens and the output voltage is not changed.

To determine whether the hum is introduced by the "A" supply or the "B" supply, batteries may be substituted for each separate supply while one circuit is being tested.

IMPORTANT - READ CAREFULLY

The "A" supply of this power unit is supplied through a dry disc rectifier. If the radio ceases to operate or drops off in performance, it may be due to a chemical change in this rectifier. This may cause the "A" voltage to drop low enough to affect the performance of the receiver.

To reactivate the rectifier it is only necessary to short (connect together) the "A" plus and "A" minus of plug or terminals of socket for a period of 4 minutes. The high temperature developed in the rectifier during this period has the tendency to restore the discs to their normal rectifying capacity. The unit will not be harmed by this process.

This deactivated condition is more likely to occur in the rectifier when the power unit has been out of service for some length of time (4 months or more).

	"A" OUTPUT	"B" OUTPUT
4-5 Tube	1.50 V at 200 Ma. 1.35 V at 250 Ma.	90 V at 13 Ma. 101 V at 8.5Ma.
6 Tube	1.55 V at 300 Ma. 1.35 V at 350 Ma.	138 V at 0 Ma.

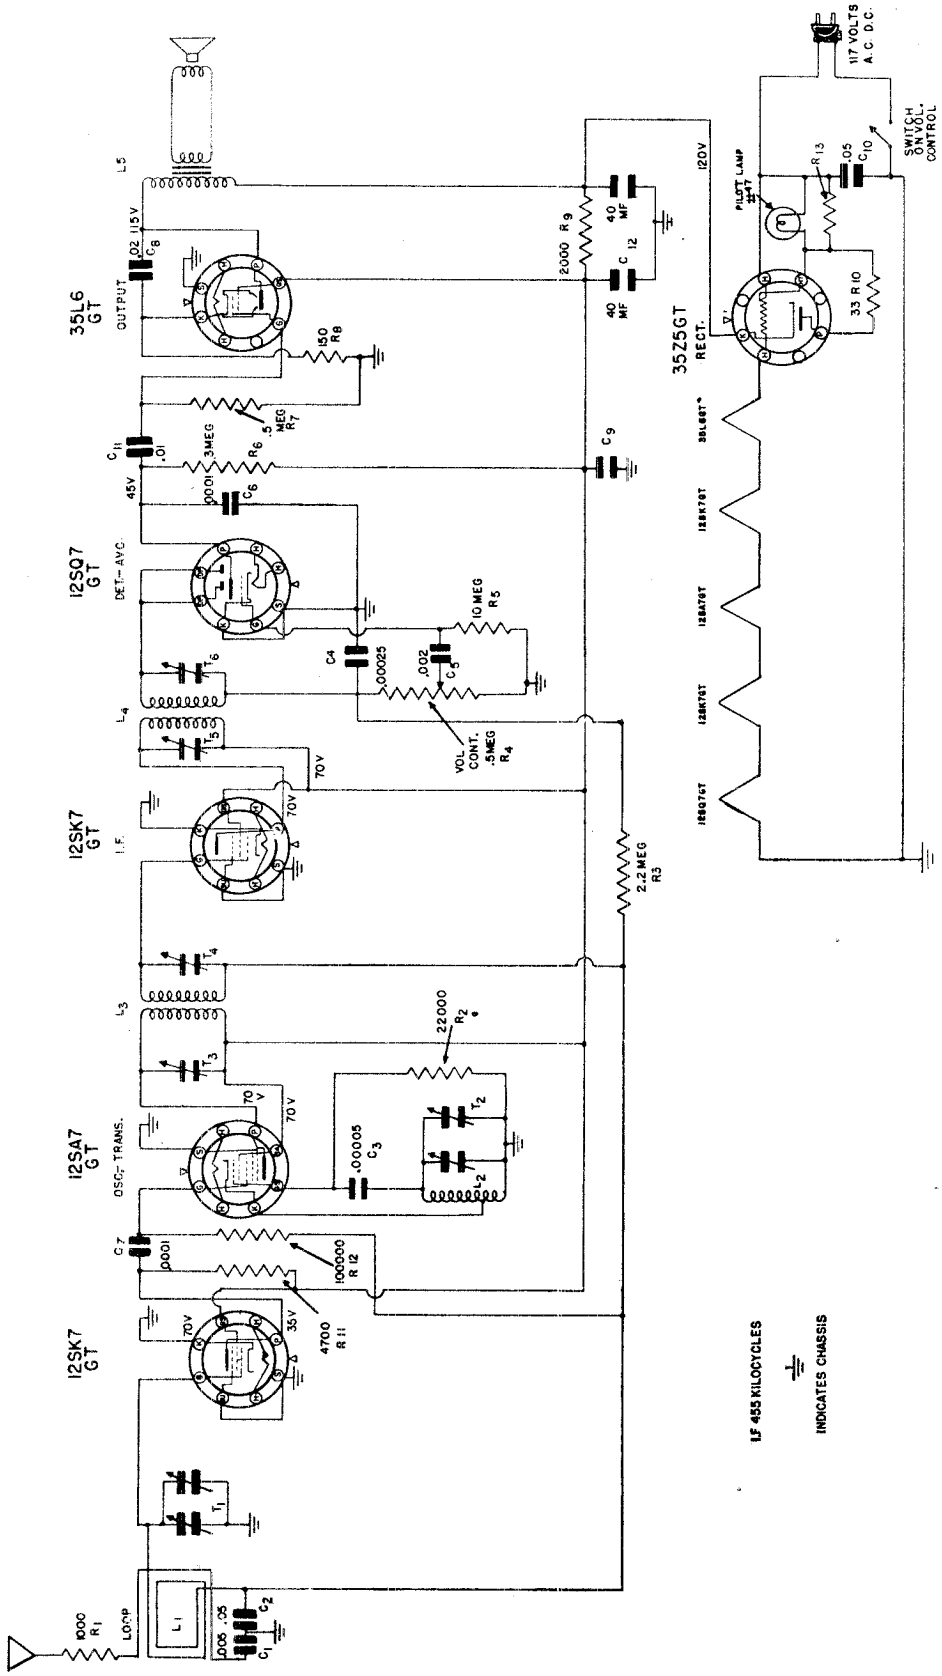
SEARS ROEBUCK & CO.



DIAL LAMP:

A six volt bayonet dial lamp No. 47 is used in this receiver. The dial lamp may be removed for replacement by gently squeezing the dial lamp socket mounting bracket and withdrawing from the dial assembly. Replace the lamp with another of the same type. DISCONNECT THE RECEIVER FROM THE ELECTRICAL OUTLET BEFORE REPLACING THE LAMP.

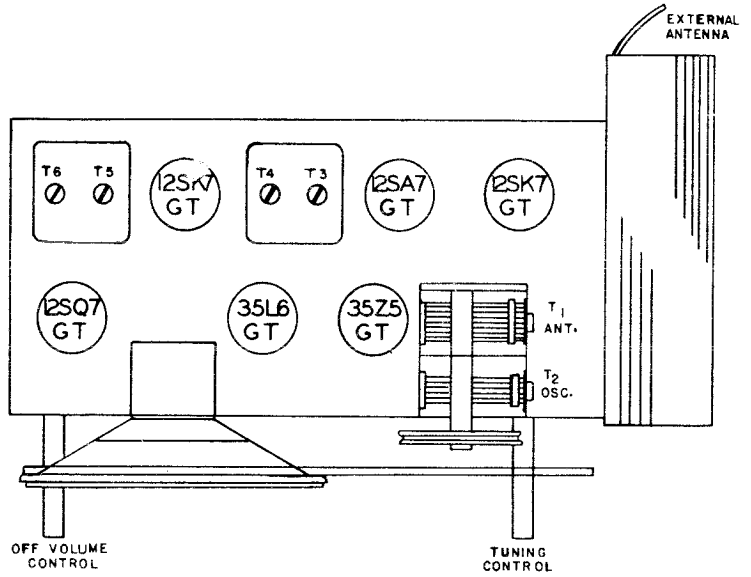
		Variable Condenser



Output meter connections	Across primary output transformer
Connection of generator ground	Chassis
Generator modulation	App. 30% @ 400 cycles
Position of volume control	Fully Clockwise

POSITION OF DIAL POINTER	GENERATOR FREQUENCY	GENERATOR CONNECTION	TRIMMERS ADJUSTED	TRIMMER FUNCTION
540 kc	455 kc	12SA7GT	T3, T4, T5, T6	I. F.
1500 kc	1500 kc	* * *	T2, T1	Osc., R. F.

It is advisable to repeat the entire alignment procedure in the original order to insure greater accuracy.

Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

***Run a wire from the output terminal of the generator near the receiver. However, no connection is made between the signal generator and the receiver.

ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third. IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

When adjusting 1620 kilocycle oscillator trimmer 600 K.C. padder, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, do not connect test oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator loop near set loop—BE SURE THAT NEITHER MOVES WHILE ALIGNING.

Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
I. F. alignment use any band position.	Any point where no interfering signal is received	Exactly 455 K.C.	0.2 Mfd. condenser	High side to grid of 6SA7 tube. Low side to frame of gang condenser.	Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.
1620 to 540 K.C. Band	1 Rotate gang condenser to Maximum Capacity	Exactly 455 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser.	Adjust R.F. coil for minimum 455 K.C. signal.
	2 Exactly 1620 K.C.	Exactly 1620 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser.	Adjust 1620 K. C. oscillator trimmer for maximum output.
	3 Approx. 1400 K.C.	Approx. 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser.	While rocking gang condenser adjust 1400 K. C. loop trimmer for maximum output.
	4 Approx. 600 K.C.	Approx. 600 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser.	While rocking gang condenser adjust 600 K. C. oscillator padder for maximum output.
2.2 to 7.5 M.C. Band	1 Exactly 7.5 M.C.	Exactly 7.5 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	Adjust 7.5 M. C. oscillator trimmer for maximum output.
	2 Approx. 6. M.C.	Approx. 6. M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	While rocking gang condenser adjust 6 M. C. antenna trimmer for maximum output.
7.5 to 24 M.C. Band	1 Exactly 24 M.C.	Exactly 24 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	Adjust 24 M. C. oscillator trimmer for maximum output.
	2 Approx. 20 M.C.	Approx. 20 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	While rocking gang condenser adjust 20 M. C. antenna trimmer for maximum output.

F E D C B A

©John F. Rider

The loop aerial cannot be used for short wave reception. WHEN TUNING FOR SHORT WAVE 2.2-7.5 AND 7.5-24 M.C. BAND STATIONS, CONNECT A 25-50 FOOT OUTDOOR AERIAL TO THE RADIO.

THERE ARE THREE AERIAL & GROUND POSTS marked "A," "D," and "G" on the rear of the chassis. When the receiver is shipped from the factory a flexible wire is connected to post "D" and "G." When a straight aerial is used this wire should be left in this position and the aerial lead-in connected to the post marked "A."

When a doublet type antenna is used, remove the small piece of wire connecting "G" and "D" posts together and attach one of the doublet antenna lead-ins to "A" post and the other to "D" post.

The metal arm on loop need not be moved to "Ant" position as arm is inoperative when band selector switch is in 2.2-7.5 and 7.5-24 M.C. bands position.

REGARDLESS OF THE TYPE OF AERIAL USED ALWAYS HAVE A GOOD GROUND ATTACHED TO THE POST MARKED "G" ON REAR OF CHASSIS. A cold water pipe, steam radiator or an iron rod driven 3 or 4 feet into moist ground will provide a suitable ground.

PUSH BUTTON TUNING

SIX STATIONS OPERATING IN THE 1620-540 K.C. BAND MAY BE "AUTOMATIC PUSH BUTTON" TUNED BY PROPERLY SETTING THE 6 SETS OF TRIMMER SCREWS LOCATED UNDERNEATH PUSH BUTTON ESCUTCHEON ON FRONT OF CABINET.

As the push buttons are not preset at the factory for any definite stations, be sure to set them by:

(a) It is important to have the aerial, if an outdoor antenna is to be used, attached to the radio when adjusting the trimmers.

(b) BE SURE TO OPERATE THE RADIO AT LEAST ONE-HALF HOUR BEFORE ADJUSTING TRIMMERS. If set is not thoroughly warmed up when trimmers are adjusted, the trimmers may shift position after they do become warm, resulting in poor tone, weak signals and excessive background noise.

(c) Obtain the transmitter frequency—number of kilocycles—and call letters of the six stations you wish to "Push Button" tune. FOR BEST RESULTS SET PUSH BUTTONS FOR LOCAL OR STRONG NEAR-BY STATIONS ONLY.

(d) Remove push button escutcheon from front of cabinet by unscrewing small wood screws that hold this in place.

(e) Rotate band switch to the next to the maximum right hand position.

(f) Using manual tuning knob, carefully tune in to the point of clearest tone, one of the selected stations whose transmitter frequency is somewhere between 540 and 900 kilocycles.

(g) Rotate band switch knob to the maximum right hand position.

(h) Press in either one of the two push buttons indicated on label adjacent to trimmers marked 540 to 900 K.C. Note: Station signal will disappear, or may be distorted and in some instances another station may be heard.

(i) Using a screwdriver ADJUST THE LARGE 540 to 900 KILOCYCLE ADJUSTING SCREW, LOCATED ABOVE THE PUSH BUTTON THAT IS PUSHED IN—until the 540 to 900 kilocycle station that had been previously tuned in with the manual tuning knob, is heard with maximum volume and clearest tone. AFTER ADJUSTING THE LARGE SCREW CAREFULLY ADJUST THE SMALL SCREW DIRECTLY BELOW THE LARGE ONE FOR CLEAREST TONE AND MAXIMUM VOLUME.

(j) Remove the printed tab, having the call letters of the station tuned in, from the paper call letter sheet. Press this into the depression in the push button escutcheon that will be adjacent to the push button just adjusted when the escutcheon is remounted in place on the cabinet.

(k) Set other trimmers for selected stations operating between the frequency range of the trimmers, as indicated on the label.

IMPORTANT: THE WAVE SWITCH KNOB MUST BE IN THE MAXIMUM RIGHT HAND POSITION FOR PUSH BUTTON TUNING.

In some instances it may be necessary, after the set is operated for a period of time, to reset the trimmers as they may drift due to heat, humidity, etc.

THE FOLLOWING PARTS LIST, WIRING DIAGRAM AND ALIGNMENT CHARTS ARE INTENDED FOR USE BY PROFESSIONAL SERVICE MEN

If your radio should ever require attention, show this data to your service man . . . it will help him to make a faster and better adjustment.

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	Any point where no interfering signal is received.	455 K. C.	.02 MFD. condenser	High side to rear stator plates of tuning condenser. Low side to frame of condenser through a .02 Mfd. blocking condenser.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
2	Exactly 1730 K. C.	Exactly 1730 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	Approx. 1400 K. C.	Exactly 1400 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.

40E1	Pilot Lamp	6-8 Volt .150 Amp. Type 47 Lamp

*NOTE: First production run of this model used Oscillator Coil Part Number 20E13, Illus. No. 4, with the 47 Ohm Resistor, Illus. No. 41, and the value of the 12SA7 grid leak Resistor, Illus. No. 23, was 47,000 Ohms.
In later production, Part Number 20E13, Oscillator Coil, was replaced with Part Number 20E162; also the 47 Ohm Resistor, Illus. No. 41, was eliminated and the value of Resistor, Illus. No. 23, was changed to 22,000 Ohms.
BECAUSE PERFORMANCE OF THE SET WILL BE SOMEWHAT IMPROVED BY USING OSCILLATOR COIL Part Number 20E162, WE RECOMMEND THAT WHENEVER IT IS NECESSARY TO REPLACE THE OSCILLATOR COIL, THAT ONLY Part Number 20E162 BE USED FOR THIS PURPOSE.

MODEL 289-T

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, etc.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	I.F. Any point where no interfering signal is received	455 K. C.	.02 MFD. condenser	High side to grid terminal of 1A7GT tube DO NOT REMOVE CAP. Low side to receiver black ground lead.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
2	Exactly 1730 K. C.	Exactly 1730 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	Exactly 1400 K. C.	Exactly 1400 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.

For Alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.
IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET. BE SURE THAT IT DOES NOT MOVE WHILE ALIGNING.

When adjusting 1650 kilocycle oscillator trimmer, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, connect test oscillator to loop external antenna and ground connections with a .0002 Mfd. capacitor in series with antenna lead.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to	Refer to parts layout diagram for location of trimmers mentioned below:
	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to grid of 12SA7 tube. Low side to chassis (if non-Underwriter Approved) or Common Negative (if Underwriter Approved).	Adjust each of the 2nd I.F. transformer trimmer adjustment screws for maximum output, then adjust each of the 1st I.F. transformer trimmer adjustment screws for maximum output.
1	Rotate gang condenser to maximum capacity	Exactly 455 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust R. F. coil trimmer for minimum 455 K. C. signal.
2	Rotate gang condenser to minimum capacity	Exactly 1650 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1650 K. C. oscillator trimmer for maximum output.
3	Approximately 1400 K. C.	Approx. 1400 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1400 K. C. antenna trimmer for maximum output.

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next, (3) third, etc.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) Place loop antenna in the same position it will be in when set is in the cabinet.

Steps	Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	I.F. alignment use any band position.	Any point where no interfering signal is received	Exactly 455 K.C.	0.2 Mfd. condenser	High side to rear stator plates of tuning condenser. Low side to frame of condenser through .01 Mfd. condenser.	Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.
2	1620 to 538 K.C. Band	Rotate gang condenser to Maximum Capacity	Exactly 455 K.C.	.00025 Condenser	High side to BLUE Antenna Lead. Low side to chassis through a .01 mfd. condenser.	Adjust R.F. coil trimmer for **minimum** 455 K.C. signal.
		Exactly 1620 K.C.	Exactly 1620 K.C.			Adjust 1620 K.C. oscillator trimmer for maximum output.
		Approx. 1400 K.C.	Approx. 1400 K.C.			While rocking gang condenser adjust 1400 K.C. loop trimmer for maximum output.
		Approx. 600 K.C.	Approx. 600 K.C.			While rocking gang condenser adjust 600 K.C. oscillator padder for maximum output.

ALIGNMENT PROCEDURE

For Alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.
IMPORTANT: BEFORE ALIGNING, HAVE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET. BE SURE THAT IT DOES NOT MOVE WHILE ALIGNING.

When adjusting 1650 kilocycle oscillator trimmer, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, connect test oscillator to loop external antenna and ground connections with a .0002 Mfd. capacitor in series with antenna lead.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to	Refer to parts layout diagram for location of trimmers mentioned below:
	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to grid of 6SA7 Tube. Low side to chassis.	Adjust each of the 2nd I.F. transformer trimmer adjustment screws for maximum output, then adjust each of the 1st I.F. transformer trimmer adjustment screws for maximum output.
1	Rotate gang condenser to maximum capacity	Exactly 455 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust R.F. coil trimmer for **minimum** 455 K. C. signal.
2	Rotate gang condenser to minimum capacity	Exactly 1650 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1650 K. C. oscillator trimmer for maximum output.
3	Approximately 1400 K. C.	Approx. 1400 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1400 K. C. antenna trimmer for maximum output.

PART NO. 292-K

VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE ON 110-120 VOLT 60 CYCLE ALTERNATING CURRENT (AC).

OUTSIDE AERIAL

If the radio is used in shielded areas or located a great distance from broadcast stations, the volume of some or all stations may not be ample, in which case it would be necessary to ATTACH a 25-50 ft. OUTDOOR AERIAL TO THE BLUE LEAD COMING OUT OF THE REAR OF THE CHASSIS.

GROUND

When a regular aerial is used, best results will be obtained with a ground attached to the black lead coming out of the rear of the chassis.

FUNCTION OF CONTROLS ON RADIO

THE LEFT HAND KNOB controls the volume control and Off-On switch.

THE CENTER KNOB is the tone control.

THE RIGHT HAND KNOB is the station selector.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective position on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on the gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

MODEL RCU

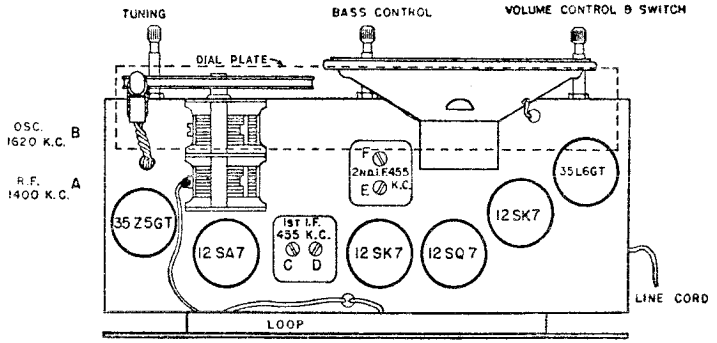
TUBE AND TRIMMER LOCATIONS

MODEL RDU



TUBE AND TRIMMER LOCATIONS

MODELS RCU AND RDU

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED. OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. Remove the chassis and speaker from the cabinet and connect output meter across primary or secondary of output transformer. With the gang condenser set at minimum, adjust the test oscillator to 455 KC, connect its output to the grid of the first detector tube (1A7GT) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna lead through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

SPECIFICATIONS

Two loops of 1/4" copper tubing 8" in diameter spaced 1/4" apart with 400 ohms resistor in series. Connecting cable and resistor must be shielded.
The loop should be spaced twice the diameter of the loop from the receiver being aligned to prevent an over modulated signal and poor alignment of the receiver.

Special Note: The first 4,000 units will be assembled using C1 as PB40402 and L4 as AB43015-1. After first 4,000 units C1 will be PB40406 mounted on a special bracket PB41913 and using L4 as AB43024-1. On part No. PB40402 trimmers C1A and C1B are located on top of the tuning condenser, while on PB40406 condenser C1A and C1B are on the bottom of the condenser and must be adjusted from chassis bottom side.

MODEL "F" COMPACT

Operates any 2 Volt—4, 5, 6 or 7 tube battery radio from 115 v. 60 cy. source.

For use in receivers employing 1A4, 1C7, 1D5, 1E5 1F5, 1F7, 1H4G, etc., tubes to change radio into an all-electric set giving maximum performance at all times. Inexpensive to operate. Excellent to use when AC current is available and save batteries for occasions when used as portable.

TECHNICAL DATA

Primary
115 Volts A.C. @ 60 cycles.

Specifications
6 foot cord and plug—switch in cord.
Size: 2⅜" x 4½" x 8¼".
Weight packed—5½ pounds.

"A" Supply Output
7 tubes . . . . . 2V. @ 480ma.
6 tubes . . . . . 2V. @ 420ma.
4-5 tubes (average) . . . . . 2V. @ 325ma.

"B" Supply Output
67, 90, 112, 135 Volts D.C. @ 18ma.

MODEL "P" COMPACT

Operates any 1.4 volt—4, 5 or 6 tube battery radio from 115 v. 60 cy. source.

Designed for sets using 1A7, 1E4, 1N5G, 1Q5G, etc., tubes to convert battery radio to an efficient AC receiver with low operating cost. Fits in battery compartment of most radios. Ideal for use in home, hotel, camp or any place where normal AC is available.

TECHNICAL DATA

"A" Supply Output
5-6 tubes (average) . 1.4V. @ 275ma
4 tubes . . . . . 1.4V. @ 250ma
4 tubes . . . . . 1.4V. @ 200ma

"B" Supply Output
90 Volts D.C. @ 12 ma. max.

Primary
115 Volts A.C. @ 60 cycles.

Specifications:
Six foot cord and plug—switch in cord.
Size: 2⅜" x 3½" x 6¾".
Weight packed—3½ pounds.

ALIGNMENT PROCEDURE

With an output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 30% at 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

Connect the signal generator to the grid cap of the 1A7 GT Tube through a .1 MFD. Condenser. Connect the ground lead of the generator to the chassis. Adjust the signal generator to 455 K.C. and set the variable condenser of the receiver to minimum capacity (fully opened). With the volume control full on and minimum output from the signal generator adjust the two trimmers on top of the first and second I.F. transformers for maximum output.

Now connect the signal generator to the antenna connection of the receiver through a .00025 condenser. Adjust the signal generator frequency to 1725 K. C. and set the variable condenser to minimum capacity (fully opened), and adjust the oscillator trimmer (C1B) for maximum output. Set signal generator to 1500 K. C. and tune receiver to signal. Adjust the antenna trimmer (C1A) on the variable condenser for maximum output.

ALIGNMENT PROCEDURE

CAUTION: This is an A.C./D. C. receiver and when aligning the set it is necessary to **isolate the Signal Generator or the receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.**

Connect the Signal Generator through a .1 MFD. condenser to the variable condenser side of the loop. Connect the ground side of the Signal Generator to the chassis. Adjust the Signal Generator to 455 Kilocycles and set the variable condenser of the receiver to minimum capacity (fully opened). With volume control full on and minimum output from the Signal Generator adjust the two trimmers on top of the 1st and 2nd I.F. transformers (T3-T4) for maximum output. Now connect the Signal Generator through a .00025 condenser to the **external** antenna connection on the back of the loop. Connect ground side of Signal Generator to terminal marked "G" on back of loop. Adjust frequency to 1630 K. C., set variable condenser at minimum capacity (fully opened) and adjust the oscillator trimmer (C11) for maximum output. Set Signal Generator to 1400 K.C., tune receiver to signal and adjust the Antenna trimmer (C12) on top of the variable condenser for maximum output.

ALIGNMENT AND SERVICE DATA

(For Professional Service Men Only)

Remove chassis from cabinet for alignment.

A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC.

First Step: Connect the generator lead through a .1 mfd. condenser to the terminal lug next to the Antenna trimmer on top of the tuning condenser. The ground lead from the generator may be connected to any convenient spot on the metal chassis. Adjust generator to 456KC and adjust IF trimmer screws until a maximum reading is noted on the output meter which has been connected across the speaker. The tuning condenser should be turned out to complete minimum capacity when aligning the IF. With generator lead still connected to antenna trimmer terminal, adjust generator frequency to 1720KC, and with tuning condenser still at minimum, adjust oscillator trimmer till the 1720KC signal is tuned in. Next, remove generator leads from set and connect both to a transmitting loop. This loop can be made with 2 turns of wire about 6 inches in diameter and placed about one foot away from the loop antenna of the receiver. Adjust generator frequency to 1400KC. Turn tuning condenser until the signal is tuned in and adjust antenna trimmer until a maximum reading is noted. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory so as to insure proper alignment at the lower frequency end of the dial.

ALIGNMENT AND SERVICE DATA

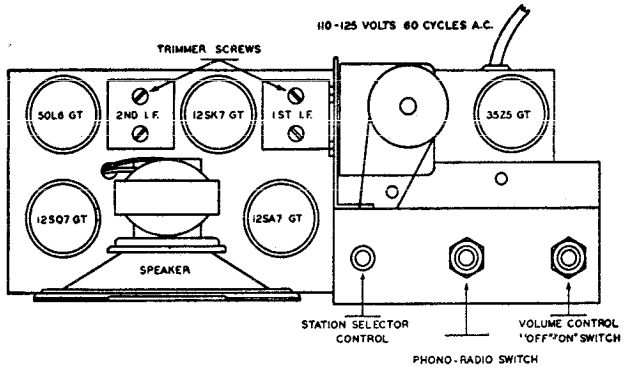
(For Professional Service Men Only)

Remove chassis from cabinet for alignment.

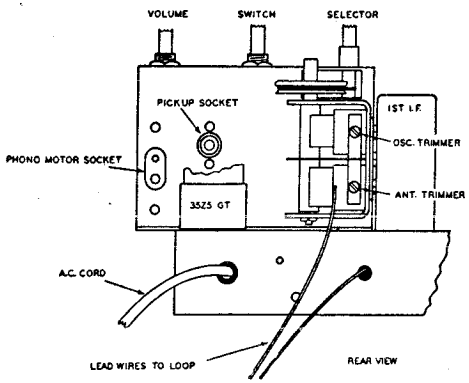
A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC.

First Step: Connect the generator lead through a .1 mfd. condenser to the terminal lug next to the Antenna trimmer on top of the tuning condenser. The ground lead from the generator may be connected to any convenient spot on the metal chassis. Adjust generator to 456KC and adjust IF trimmer screws until a maximum reading is noted on the output meter which has been connected across the speaker. The tuning condenser should be turned out to complete minimum capacity when aligning the IF. With generator lead still connected to antenna trimmer terminal, adjust generator frequency to 1720KC, and with tuning condenser still at minimum, adjust oscillator trimmer till the 1720KC signal is tuned in. Next, remove generator leads from set and connect both to a transmitting loop. This loop can be made with 2 turns of wire about 6 inches in diameter. Adjust generator frequency to 1400KC. Turn tuning condenser until the signal is tuned in and adjust antenna trimmer until a maximum reading is noted. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory so as to insure proper alignment at the lower frequency end of the dial.

TUBE AND TRIMMER LOCATION



TRIMMER AND CONNECTOR SOCKET LOCATION



MODELS TK-504, TK-514

Remove the chassis from the cabinet for alignment.

A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC, 6MC, 16MC, 18.3MC. An output meter should be connected across the speaker.

I. F. Alignment: Connect the generator lead through a .1MFD condenser to the terminal lug on the "Antenna" section of the gang condenser. The ground lead from the generator should be connected to the chassis base. Set the generator at 456KC. Adjust the trimmer screws in the 1st and 2nd I. F. cans (see Fig. No. 1) until a maximum reading is noted on the output meter.

The receiver volume control should be turned to maximum during the I F and all subsequent alignments, to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

BC or Broadcast Alignment: With the generator leads still connected as in I. F. Alignment, rotate the tuning condenser to complete minimum capacity. Set the generator to 1720KC. Adjust the BC oscillator trimmer until the signal is tuned in. Next, remove the generator leads and connect them to the antenna lead of the loop antenna, through a 100 MMFD condenser. Set the generator to 1400KC and rotate the tuning condenser until the signal is tuned in. Adjust the BC antenna trimmer until a maximum reading is noted on the output meter. Set the generator to 600KC and turn the tuning condenser until the signal is tuned in. Rock the tuning control back and forth slowly until a maximum reading is noted on the output meter. It is advisable to return to the 1720KC adjustment and recheck that setting to make sure it has not changed while padding at 600KC.

SW or Short Wave Alignment: Set the generator at 18.3MC. Turn the receiver band switch to short wave position. Turn the tuning condenser to complete minimum capacity. The generator leads should be connected to the antenna lead of the loop through a 400 Ohm resistor. Adjust the S. W. oscillator trimmer slowly until the 18.3MC signal is tuned in. At this point, it will be well to make sure that the fundamental signal is tuned in. Turn up the generator output and tune the receiver to approximately 17.3MC. At this point, the 18.3MC signal will be heard again but much weaker. This is the image frequency. If the image is not heard, then turn the tuning condenser back to complete minimum and readjust the SW oscillator trimmer. Remember the image must always be heard (at 2 times the IF frequency in KC) lower in frequency than the fundamental signal. After the oscillator has been properly set, tune the signal generator to 16MC and rotate the tuning control until the signal is tuned in. Adjust the SW antenna trimmer until a maximum reading is noted on the output meter. It is advisable to rock the gang slowly while adjusting the antenna trimmer. Set the generator to 6MC and tune the signal in on the receiver. Check the alignment at this frequency. No adjustment should be necessary, as the coils have been carefully checked before leaving the factory. A fixed oscillator padding condenser is used at 6MC.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd. — 200 mmf. — 400 ohms

CONNECT TEST OSCILLATOR TO	DUMMY ANTENNA	INPUT SIGNAL FREQUENCY	BAND	SET DIAL AT	TRIMMERS	PURPOSE
12SA7GT grid	.1 mfd.	455 kc.	Broadcast	HF end	C D E F	Align IF
12SA7GT grid	.1 mfd.	1620 kc.	Broadcast	HF end	B	Set limit of band
Ant. terminal	400 ohms	18.3 mc.	Short Wave	HF end	C-9	Set limit of band
Ant. terminal	400 ohms	18.0 mc.	Short Wave	18 mc.	C-2	Align antenna
Ant. terminal	200 mmf.	1400 kc.	Broadcast	1400 kc.	C-3	Align antenna
Ant. terminal	200 mmf.	600 kc.	Broadcast	600 kc.	C-6	Rock gang and adjust to max.

NOTE: Recheck alignment of trimmers B and C-3 after adjusting C-6.

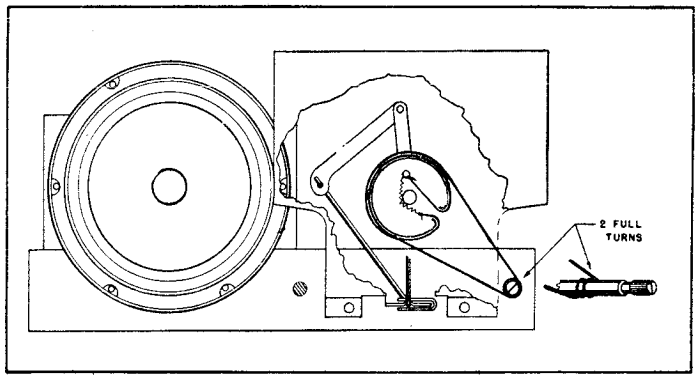
ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

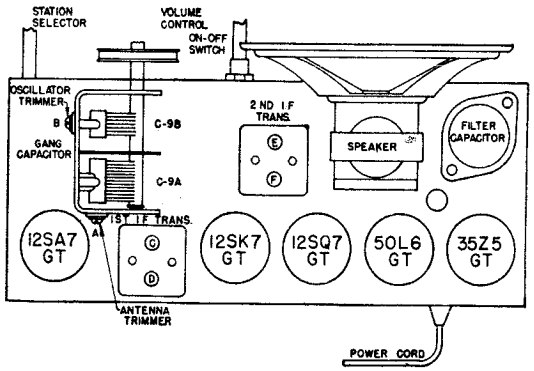
1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd., — RMA loop.

NOTE: Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12SA7GT grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

GENERATOR	CONNECTION AT RADIO	DUMMY ANTENNA	DIAL	TO TUNE TRIMMERS	REMARKS
IF 455 kc.	12SA7GT grid	.1 mfd.	HF end	IF trimmers C D E F	Tune to max.
1620 kc.	Through loop	RMA loop	HF end	Osc. trimmer B	Set limit of band
1400 kc.	Through loop	RMA loop	1400 kc.	Ant. trimmer A	Tune to max.



Dial Mechanism



Tube Layout

Electrical and Mechanical Specifications

Frequency Range ..... 540-1600 kc.
Intermediate Frequency ..... 455 kc.
Power Supply ..... 105-125 volts AC-DC
Loudspeaker ..... Dynamic
V.C. Impedance ..... 3.5 ohms at 400 cycles
Power Output (Undistorted) ..... .75 watts
Power Output (Maximum) ..... 1.5 watts
Tuning Drive Ratio ..... 3 to 1

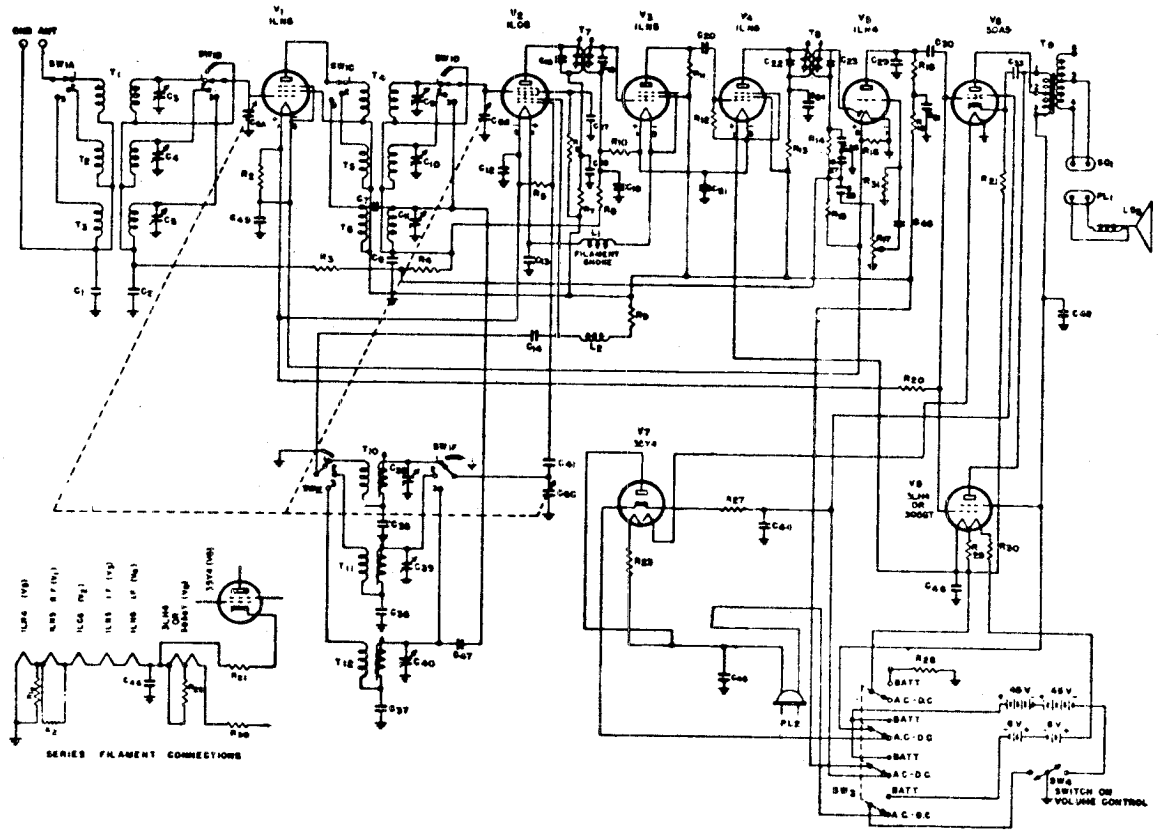
MODEL 581

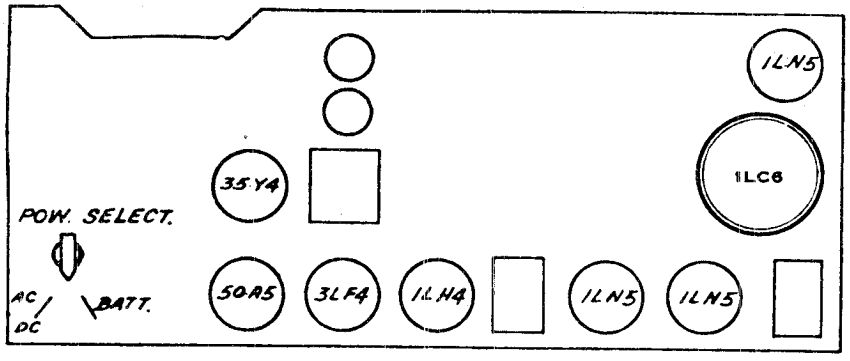
SPIEGEL



Batteries:

Two six (6) volt "A" batteries and two forty five (45) volt batteries are required for self-contained operation. These batteries are located under the chassis and may be inserted or replaced by removing the machine screw on either side of the cabinet holding the battery plate in place. The "A" batteries will provide approximately 30 hours of normal operation allowing the batteries to recuperate after several hours use. The "B" batteries will normally outlast two sets of "A" batteries. Batteries should be removed if radio set is to be stored for more than sixty (60) days.

Tube Location:



Batteries:

Suitable batteries for use with this Receiver are:
"A" Batteries: 6 Volt; Length, $3\frac{15}{16}$"; Width, $2\frac{3}{4}$"; Height, $5\frac{1}{2}$"; such as: Ever-Ready #718 or equivalent.
"B" Batteries: 45 Volt; Length, $4\frac{3}{16}$"; Width, $2\frac{19}{32}$"; Height, $5\frac{3}{8}$": such as: Ever-Ready #762-S, Burgess #5308, or equivalent.

PL2—Plug, line cord

Operate on:

(a) 105-125 Volts A.C., 60 cycle.
(b) 105-125 Volts D.C.
(c) Self contained batteries.

The instrument provides for commercial broadcast and short wave reception in the following frequency ranges:

(a) .54-1.7 M.C.
(b) 3.5-8.5 M.C.
(c) 8.5-19.5 M.C.

Electric Operation:

Set the power selector switch mounted on the rear left hand side of the chassis to "A.C.-D.C." for electric operation.

Battery Operation:

For battery operation, the power selector switch is set to the position marked "Batt". This switch is easily accessible through a door in the rear of the cabinet.

Unwind the hank antenna, connect to Antenna Binding Post and extend to full length along floor or window ledge.

Rotate control marked "ON-OFF-VOLUME in a clockwise position. This control turns the set on and permits the operator to adjust the output to the desired volume.

Select the desired frequency range by means of the control marked "Band Switch". Tuning is accomplished by rotating the control marked "Station Selector".

In locations where weak signals prevail, reception may be improved by connecting an additional outside antenna to the binding post marked "Ant". Where a ground is used, it must be connected to the binding post marked "Gnd" and NOT to the chassis directly.

Failure of the Radio Receiver to operate may be due to:

1. Incorrect setting of power selector switch.
2. Weak batteries or no current at power outlet.
3. With D.C. power — reverse position of power plug in power outlet.
4. Tubes not firmly locked in socket.
5. Defective tubes.
6. Weak reception in particular location (use longer aerial).

10-301		GANG CONDENSER

JUNE 5, 1941

To properly align receiver, it should be removed from the cabinet.

A signal generator is required, having the following frequencies: 456KC, 1400KC, 1720KC. An output meter of some kind is also necessary. (See figure No. 1 for trimmer locations).

All adjustments in aligning this receiver should be made with the volume control fully turned on, so as to prevent the A. V. C. from working and giving false readings. It is also advisable to keep the gang condenser turned all the way out to complete minimum capacity and keep the signal from the generator down as low as possible so as to prevent false peaks when aligning the I. F. transformers.

FIRST STEP: Connect the generator lead through a .1 condenser to the No. 8 pin at the 12SA7GT socket base (this is the control grid) and connect the generator ground lead to some point on the floating ground, above the .25 MFD floating ground condenser. Adjust the signal generator to 456KC and adjust the I. F. trimmer screws till a maximum reading is noted on the output meter which has been connected across the speaker leads. With the generator leads still connected to the 12SA7GT grid, adjust the generator frequency to 1720KC and adjust the oscillator trimmer till the signal is tuned in, with the gang condenser still at complete minimum.

SECOND STEP: Disconnect the generator leads from the receiver and connect both to a transmitting loop which may be made with two turns of wire about six inches in diameter and placed about one foot from the receiver loop. Adjust the generator frequency to 1400KC and turn the tuning condenser till this signal is tuned in. Adjust the antenna trimmer on the gang till a maximum reading is noted on the output meter.

Remove chassis from cabinet for alignment.
A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC. Also an output meter of some type.

First Step: Connect the generator lead through a .1 mfd. condenser to the terminal lug next to the Antenna trimmer on top of the tuning condenser. The ground lead from the generator, must be connected to the floating ground buss underneath the chassis. Adjust generator to 456KC and adjust IF trimmer screws until a maximum reading is noted on the output meter which has been connected across the speaker. The tuning condenser should be turned out to complete minimum capacity when aligning the IF. With generator lead still connected to antenna trimmer terminal, adjust generator frequency to 1720KC, and with tuning condenser still at minimum, adjust oscillator trimmer till the 1720KC signal is tuned in. Next remove generator leads from set and connect both to a transmitting loop. This loop can be made with 2 turns of wire about 6 inches in diameter and placed about one foot away from the loop antenna of the receiver. Adjust generator frequency to 1400KC. Turn tuning condenser until the signal is tuned in and adjust antenna trimmer until a maximum reading is noted. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory so as to insure proper alignment at the lower frequency end of the dial.

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the metal frame of the gang condenser. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455 KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis between the volume and tuning controls. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT. section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT. trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

ALIGNMENT PROCEDURE FOR 17-8E & 17-8E-Z CHASSIS

1. Connect the output meter in the conventional manner.
2. Connect the ground lead of the signal generator to the receiver chassis through a .25 mfd. condenser.
3. Turn the volume control to maximum volume position and turn both tone controls to the position giving highest tone.
4. PUSH THE MANUAL BUTTON IN AND KEEP IT PUSHED IN. Turn the BAND SWITCH to the BROADCAST position.
5. Connect the loop as shown under "LOOP CONNECTIONS". Try to keep the loop in the same relative position to the chassis as when in the cabinet.
6. Connect the signal generator antenna lead to the lug on the middle section of the gang condenser, using a .1 mfd. condenser in series with the lead.
7. Set the signal generator to 455 KC. and adjust trimmers 1, 2, 3 and 4 for maximum output.
8. Connect the signal generator antenna lead through a 400 ohm carbon resistor to the blue wire coming from the chassis, and turn the BAND SWITCH to the SHORT WAVE position.
9. With the signal generator and receiver dial set to 16 MC. adjust trimmer 5 to bring in signal. Check to see if image appears at 15.1 MC. on receiver dial, if it does not, realign at 16 MC with trimmer screw farther out. Recheck image.
10. Adjust trimmer 6 for maximum output at 16 MC. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
11. Place the signal generator antenna lead near the loop and turn the BAND SWITCH to the BROADCAST position.
12. With signal generator and receiver dial set at 1500 KC. adjust trimmer 7 for maximum output.
13. Now install the chassis in the cabinet.
14. Adjust trimmers 8 and 9 for maximum output at 1500 KC. as before.
15. Set signal generator to 600 KC and tune rec3iver dial to 600 KC signal. Adjust trimmer 10 for maximum output. Try to increase output by detuning the trimmer and retuning the receiver dial until maximum output is obtained.

ALIGNMENT PROCEDURE

1. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
2. Remove chassis and loop from cabinet by taking out two screws which hold chassis to bottom of cabinet. Solder approximately 8' of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location).
3. During the alignment of this receiver it will be necessary to set the dial pointer to the following frequencies: 1500 Kc., 1400 Kc. In order to avoid replacing the chassis in the cabinet each time a dial setting is required, it will be found more convenient to mark the required frequency points on the white dial background plate before starting the alignment.
4. Connect ground lead of signal generator to B— lead through a 0.25Mfd. condenser.
5. Connect output meter across the speaker voice coil (terminals at back of speaker) or from plate of 50L6GT tube to B—through a 0.1 Mfd. condenser.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go. Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top and that this seal must be removed before stem can be rotated.

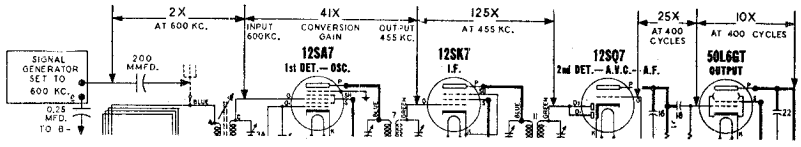
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "D" of antenna coil; then connect positive battery lead to B—. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

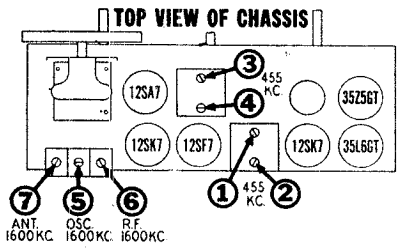

FIG. 2

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.

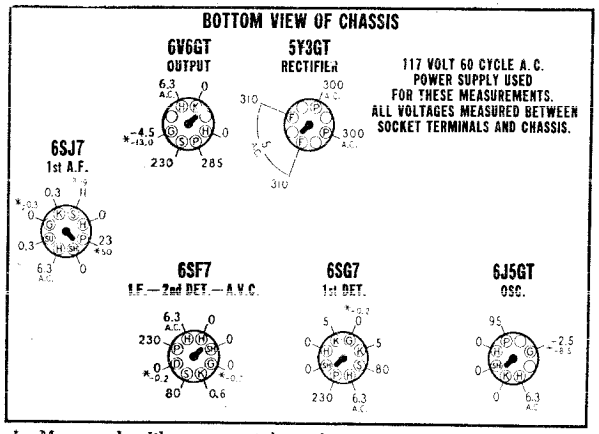
SOCKET VOLTAGES

Measured with voltmeter having sensitivity of **1000 ohms** per volt except where indicated by (*).

RADIO-PHONO-TONE SWITCH IN "RADIO-BASS" POSITION
VOLUME ON FULL WITH NO SIGNAL DIAL TUNED TO 540 KC.



*—Measured with vacuum tube voltmeter.

NOTE:—The **6V6GT** grid bias of—13 volts can be measured across resistor **No. 47.**

Record Changer: General Instruments 205

MODELS 61TR36, 61TR46

STEWART WARNER CORP.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna (cabinet back) from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.
2. With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from the plate of the 6V6GT tube to chassis through a .1 Mfd. condenser.
4. Connect the ground lead of signal generator to the receiver chassis.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIG. GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

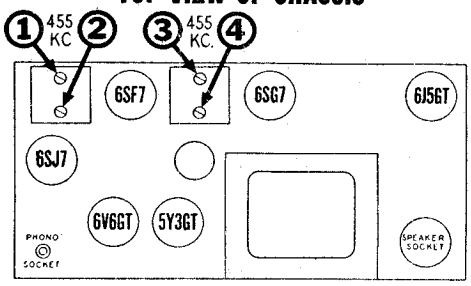
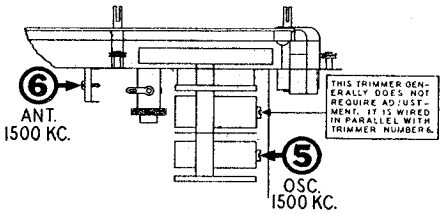
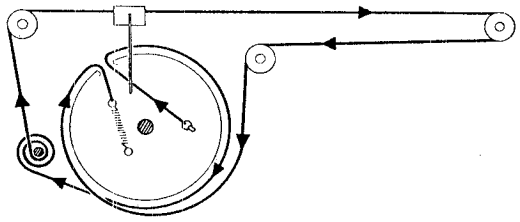
TOP VIEW OF CHASSIS



SIDE VIEW OF CHASSIS





DIAL AND POINTER DRIVE CORD ARRANGEMENT

Top view
Dial plate removed

To string dial cord, set gang condenser to fully meshed position and use following parts:

114955 Clip on end of cord
117057 Cord (4 feet)
119087 Ring for dial cord
161384 Tension Spring

IMPORTANCE OF MAINTAINING FIXED POSITIONS FOR LEADS AT TOP OF CHASSIS

The shielded leads which are routed to the "Radio-Phono" switch and volume control should be tied to the upright bracket which supports the dial assembly. Grounded shields on these leads must not be allowed to contact electrolytic condenser case. If case of condenser is grounded it will short out bias voltage for 6V6GT tube.

AUDIO OSCILLATION

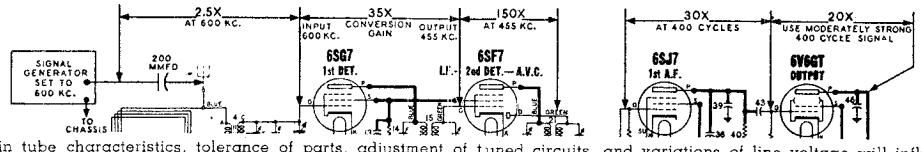
The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 K.C. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "D" of antenna coil; then connect positive battery lead to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). After chassis has been removed, replace loop antenna in cabinet. Stand the chassis on one end and space it approximately same distance from loop as when installed in cabinet. Then reconnect all leads to loop antenna and to loop of wire stapled on cabinet.
2. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 KC mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect output meter across speaker voice coil or from 6K6GT plate to chassis through a .1 Mfd. condenser.
4. Connect the ground lead of the signal generator to the receiver chassis.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 KC). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 2. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement on top and this seal must be removed before stem can be rotated.

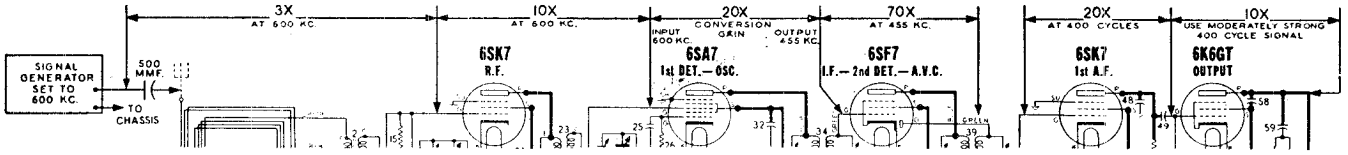
APPROXIMATE STAGE GAIN DATA

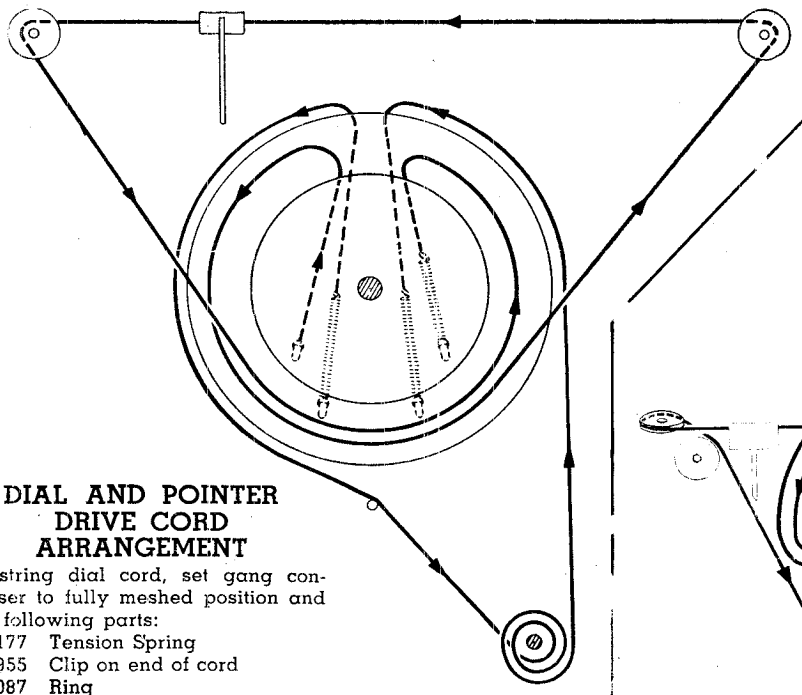
A vacuum tube voltmeter may be used for audio gain measurements. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

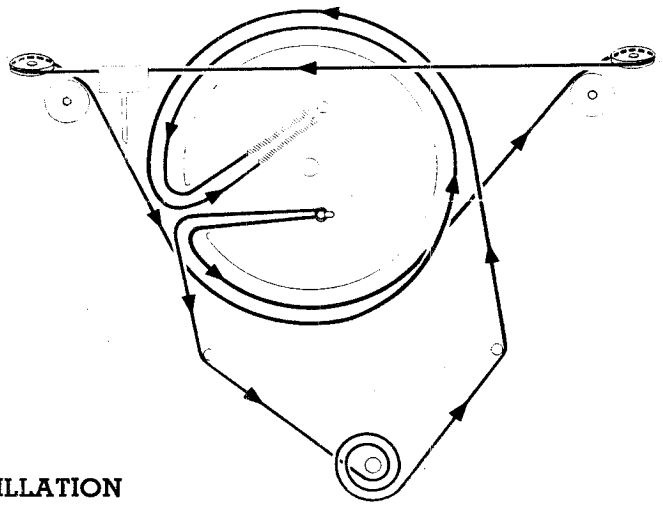
To string dial cord, set gang condenser to fully meshed position and use following parts:

113177 Tension Spring
114955 Clip on end of cord
119087 Ring
117057 Cord (61 inches)
34 inches for pointer drive
27 inches for tuning drive

(MODELS 62T16, 62TC16, 62TC26, 62TC36) DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, turn the main drive drum to maximum counter-clockwise position and use following parts:

114955 Clip on end of cord
117057 Cord (40 inches)
119087 Ring for dial cord
161384 Tension Spring



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feedback circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

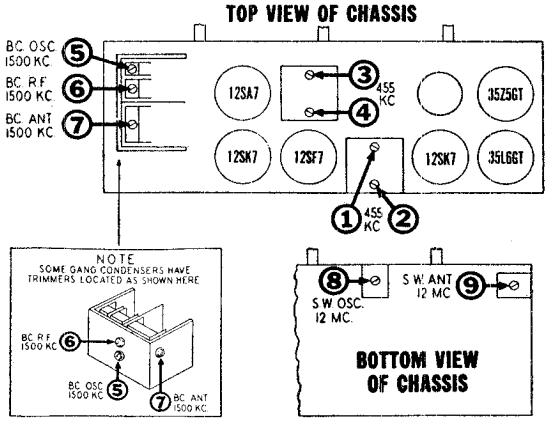
STEWART WARNER CORP. MODEL 62T36

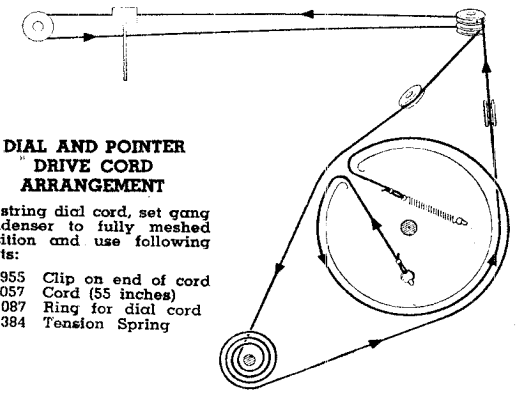
ALIGNMENT PROCEDURE

1. **Remove chassis and loop antenna from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.**
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Broadcast	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Set pointer to 12 MC. Reference line stamped into metal dial plate (second line from the right)	8	Short Wave Oscillator	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC. with trimmer screw farther out. Recheck image.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Tune to 12 MC generator signal	9	Short Wave Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

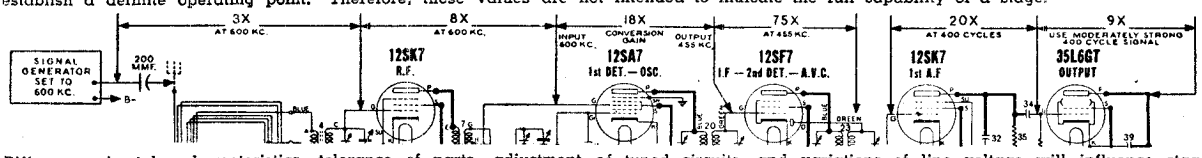
114955 Clip on end of cord
117057 Cord (55 inches)
119087 Ring for dial cord
161384 Tension Spring

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. **IMPORTANT: Disconnect battery when measuring audio stage gains.**
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

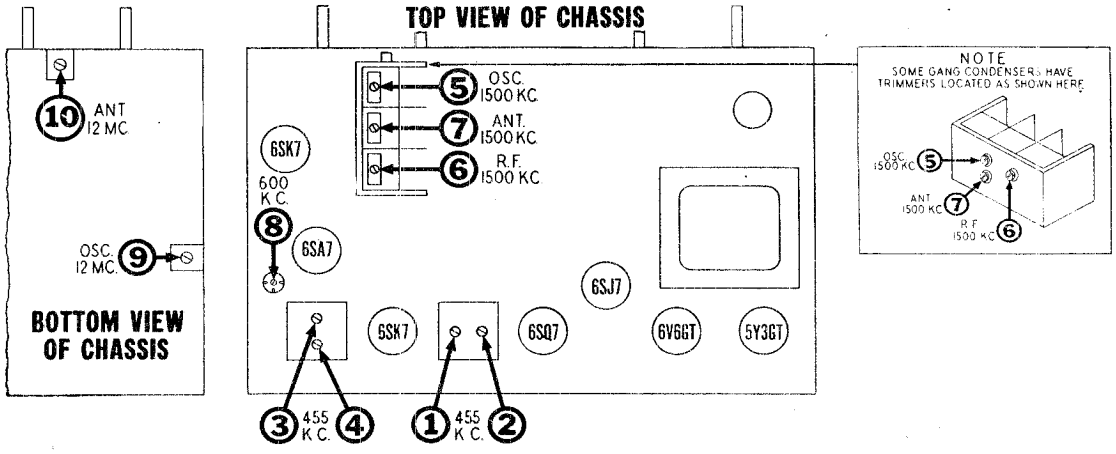
MODELS 72CR16, 72CR26

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). Wind one turn of insulated wire around frame of antenna so as to provide a means of coupling it to the signal generator. Stand chassis on one end and space it approximately same distance from loop as when installed in cabinet. Connect plug on loop antenna cable to socket at rear of chassis. Brown lead in antenna cable (which was connected to loop of wire stapled to cabinet) should now be connected to one end of new coupling turn on frame of loop.
2. Connect the ground lead of the signal generator to the receiver chassis.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil or from plate of 6V6GT to chassis through a .1 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	1500 KC	Broadcast (counter-clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 Kc. generator signal.	6	Broadcast R.F.	Adjust for maximum output.
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 Kc. generator signal.	7	Broadcast Antenna	Adjust for maximum output.
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	600 KC	Broadcast (counter-clockwise)	Tune to 600 Kc. generator signal.	8	Adjustable core of Broadcast Oscillator Coil	Adjust for maximum output. Try to increase output by rotating core in and out and retuning receiver dial until maximum output is obtained.
500 MFD. Mica Condenser	Coupling turn on Loop Frame	Repeat adjustment of trimmers 5, 6 and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	Coupling turn on Loop Frame	12 MC	Short wave (Clockwise)	12 MC	9	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	Coupling turn on Loop Frame	12 MC	Short wave (Clockwise)	Tune to 12 MC. generator signal.	10	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

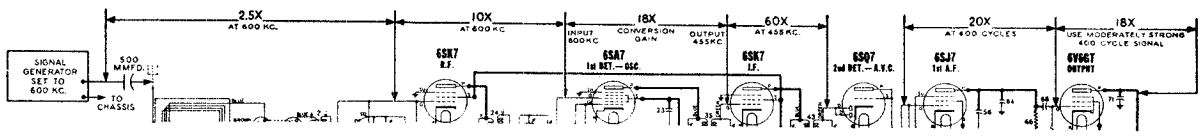
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "D" of antenna coil; then connect positive battery lead to chassis. This provides a definite operating point.
   IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

MODEL 9000-B

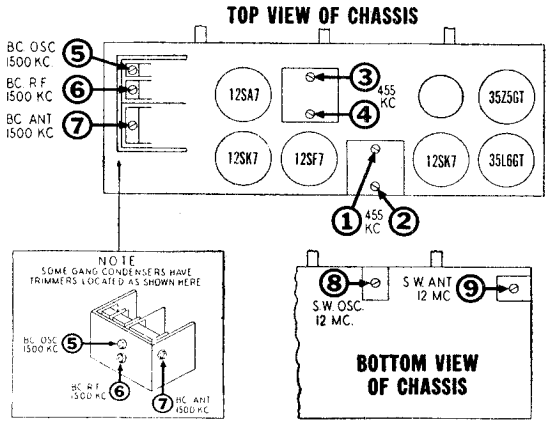
STEWART WARNER CORP.

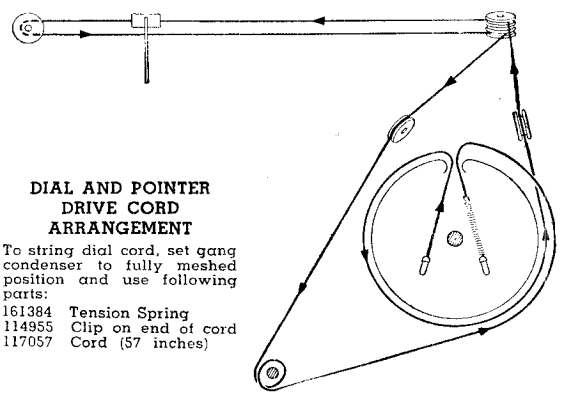
ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). After chassis has been removed, replace loop antenna in cabinet. Stand the chassis on one end and space it approximately same distance from loop as when installed in cabinet. Then reconnect all leads to loop antenna and to loop of wire stapled on cabinet.
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Broadcast	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Set pointer to 12 MC. Reference line stamped into metal dial plate (second line from the right)	8	Short Wave Oscillator	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC. with trimmer screw farther out. Recheck image.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Tune to 12 MC generator signal	9	Short Wave Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

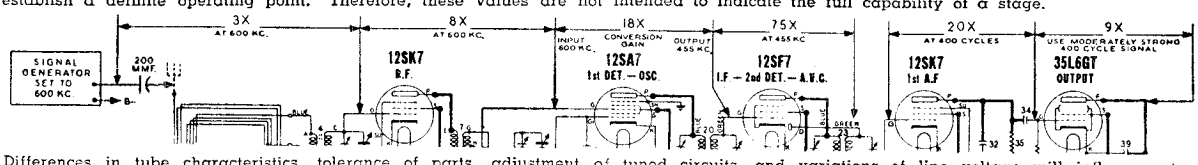
161384 Tension Spring
114955 Clip on end of cord
117057 Cord (57 inches)

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



3X AT 600 KC.
8X AT 600 KC.
18X CONVERSION GAIN
75X AT 455 KC
20X AT 400 CYCLES
9X USE MODERATELY STRONG 400 CYCLE SIGNAL
SIGNAL GENERATOR SET TO 600 KC
200 MMF.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). After chassis has been removed, replace loop antenna in cabinet. Stand the chassis on one end and space it approximately same distance from loop as when installed in cabinet. Then reconnect all leads to loop antenna and to loop of wire stapled on cabinet.
2. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect output meter across speaker voice coil or from plate to chassis through a .1 Mfd. condenser.
4. Connect the ground lead of the signal generator to the receiver chassis.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (Clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (Clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (Clockwise)	Tune to 1500 Kc. generator signal.	6	Broadcast R.F.	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (Clockwise)	Tune to 1500 Kc. generator signal.	7	Broadcast Antenna	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	600 KC	Broadcast (Clockwise)	Tune to 600 Kc. generator signal.	8	Adjustable core of Broadcast Oscillator Coil.	Adjust for maximum output. Try to increase output by rotating core in and out and retuning receiver dial until maximum output is obtained.
500 MFD. Mica Condenser	External Antenna Clip on Loop Frame	Repeat adjustment of trimmers 5, 6 and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	12 MC	Short wave (Counter-Clockwise)	12 MC	9	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	12 MC	Short wave (Counter-Clockwise)	Tune to 12 MC. generator signal.	10	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

SOCKET VOLTAGES

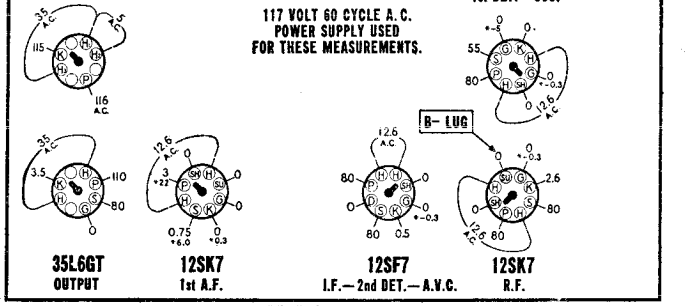
Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

VOLUME ON FULL WITH NO SIGNAL — DIAL TUNED TO 540 KC.

BOTTOM VIEW OF CHASSIS

HEATER VOLTAGES MEASURED ACROSS SOCKET TERMINALS. ALL OTHER VOLTAGES MEASURED BETWEEN SOCKET TERMINALS AND B- LUG.

117 VOLT 60 CYCLE A.C. POWER SUPPLY USED FOR THESE MEASUREMENTS.



REAR OF CHASSIS

*—Measured with vacuum tube voltmeter

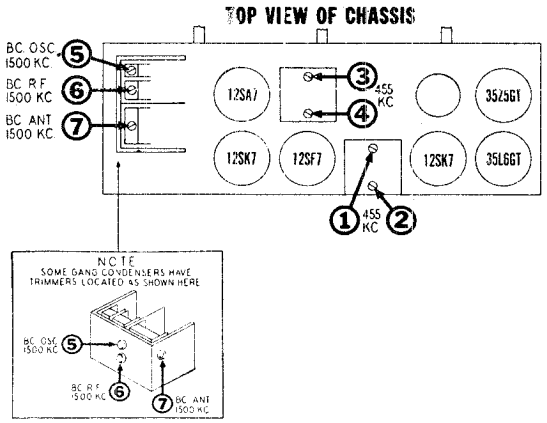
MODELS 9002-A, 9002-B, 9002-P, 9002-R

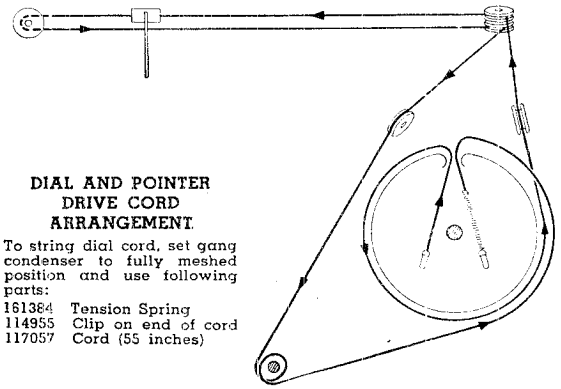
STEWART WARNER CORP.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECTION OF SIG. GENERATOR OUTPUT TO RECEIVER	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

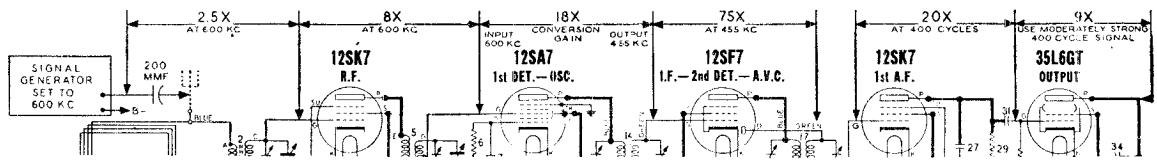
161384 Tension Spring
114955 Clip on end of cord
117057 Cord (55 inches)

APPROXIMATE STAGE GAIN DATA

A vacuum tube voltmeter may be used for audio gain measurements. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. Observe following precautions:

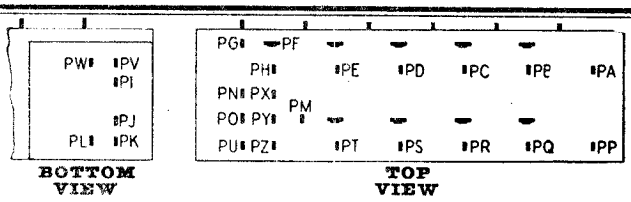
1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

©John F. Rider



NOTE: The circuit shown below applies to chassis which have a let "S" designation will have the following circuit differences.

1. Terminal "D" of BC. Antenna Coil No. 15 and terminal "P"
2. Condenser No. 73 and resistor No. 74 are omitted.

Improved sensitivity on Push Button tuning and short wave operation n in the circuit on this page and adding parts No. 73 and No. 74.

MODEL 9003-B

STEWART WARNER CORP.

ALIGNMENT PROCEDURE

1. The chassis and loop antenna should remain in their normal position in the cabinet throughout the following procedure.
2. Check arrangement of leads to push-button switch as shown in illustration on following page.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil.
5. Connect the ground lead of the signal generator to the receiver chassis.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.
7. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.

MODEL 9003-B

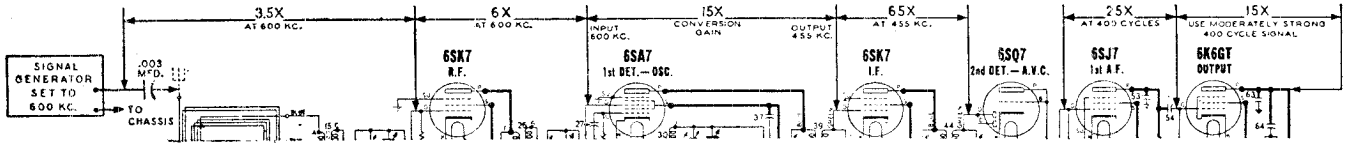
STEWART WARNER CORP.

APPROXIMATE STAGE GAIN DATA

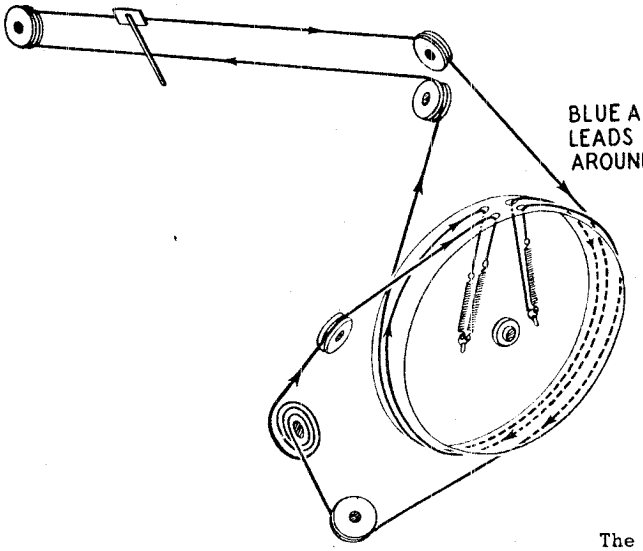
Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



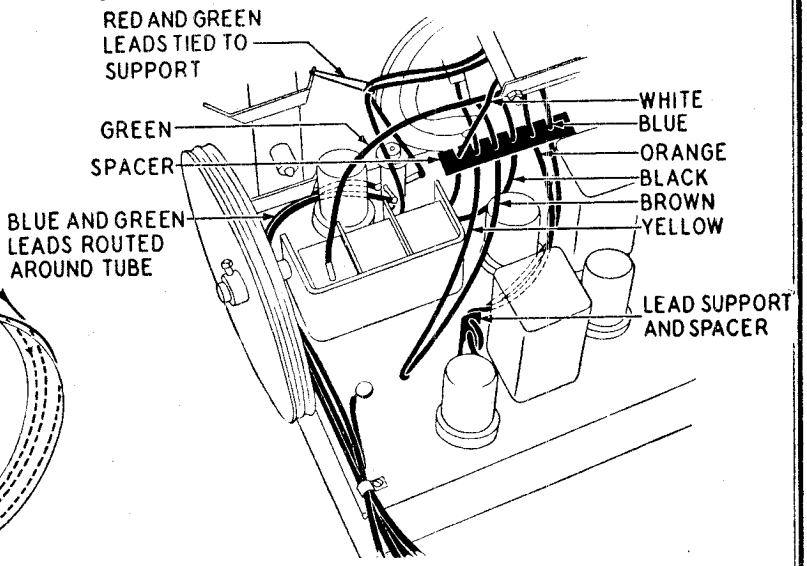
Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

113177	Tension Spring
114955	Clip on end of cord
119087	Ring for dial cord
117057	Cord (102 inches) Pointer drive 72 inches Gang drive 30 inches



IMPORTANCE OF MAINTAINING FIXED POSITIONS FOR LEADS AT TOP OF CHASSIS

The wires shown in the above illustration are associated with tuned circuits which carry radio frequency currents. Therefore, care must be exercised to insure that they are properly routed and spaced. Anchoring and fixing spacing of wires minimizes freedom of movement and is utilized to maintain a stable arrangement.

Since the relative positions of these wires may affect tuned circuits it is important to avoid any change in arrangement after the receiver has been aligned. If the position of the wires has been disturbed, it is advisable to re-check alignment (see previous page for alignment procedure).

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feedback circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

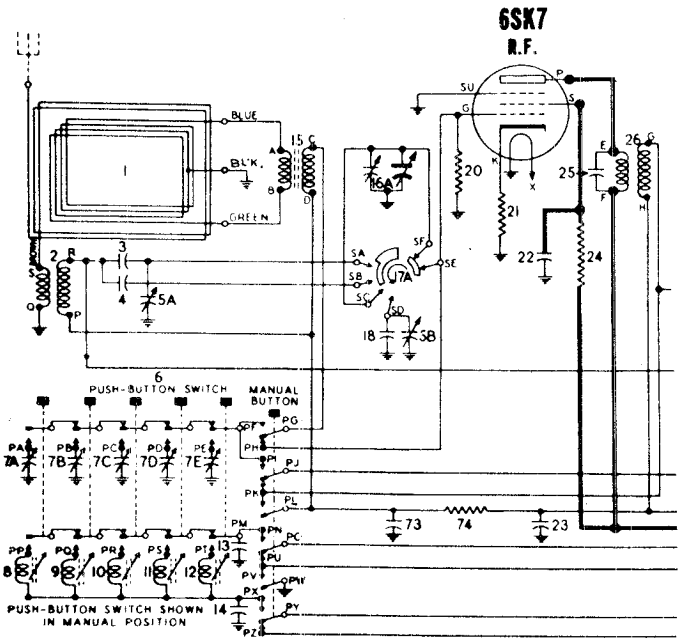
MODEL 9003-B
2nd Revision

STEWART WARNER CORP.



When the model 9003-B is operated on push-button tuning it is possible for a "wide tolerance" 6SA7 tube to cause considerable reduction in sensitivity which may be particularly noticeable when comparison is made to the sensitivity obtained for "manual" tuning. This loss of sensitivity has been traced to a wide variation in one of the characteristics of the 6SA7 tube which permits the flow of a larger than normal grid current. Loss of sensitivity results from the loading effect of grid current flowing through the associated tuned circuit.

Correction of this condition may be accomplished by utilizing one or both of the following remedies.

REMEDY #1: Try replacing the 6SA7 tube; use several different tubes, preferably of different brands, and check the performance of the set with each tube. In event a replacement tube is not available or if changing the tube does not make any improvement, apply remedy #2.

REMEDY #2: The application of this remedy requires that the chassis be removed from the cabinet. After this has been done, you can then make the following changes. These changes make it possible to use the same 6SA7 tube that was supplied with the set and still obtain a considerable improvement in sensitivity when using push-button tuning.

CIRCUIT CHANGES

1. Remove ground connection at terminal "D" of Broadcast Antenna Coil and terminal "P" of Short Wave Antenna Coil and reconnect both coil terminals to the A.V.C. system as indicated in the diagram on next page.

2. Add resistor #74 (470,000 ohms 1/2 watt) and condenser #73 (.05 mfd. 200 volt) by connecting them into the circuit as shown.

3. Check alignment of receiver by adjusting antenna circuit trimmers for maximum output. Broadcast band trimmer (16A) must be adjusted before attempting to peak Short Wave band trimmer (5A).

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). Wind one turn of insulated wire around frame of antenna so as to provide a means of coupling it to the signal generator. Stand chassis on one end and space it approximately same distance from loop as when installed in cabinet. Connect plug on loop antenna cable to socket at rear of chassis. Brown lead in antenna cable (which was connected to loop of wire stapled to cabinet) should now be connected to one end of new coupling turn on frame of loop.
2. Connect the ground lead of the signal generator to the receiver chassis.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil or from plate of 6V6GT to chassis through a .1 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

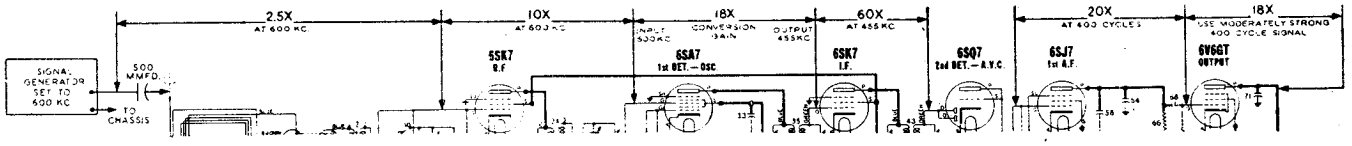
MODELS 9004-B, 9004-F, 9004-G

APPROXIMATE STAGE GAIN DATA

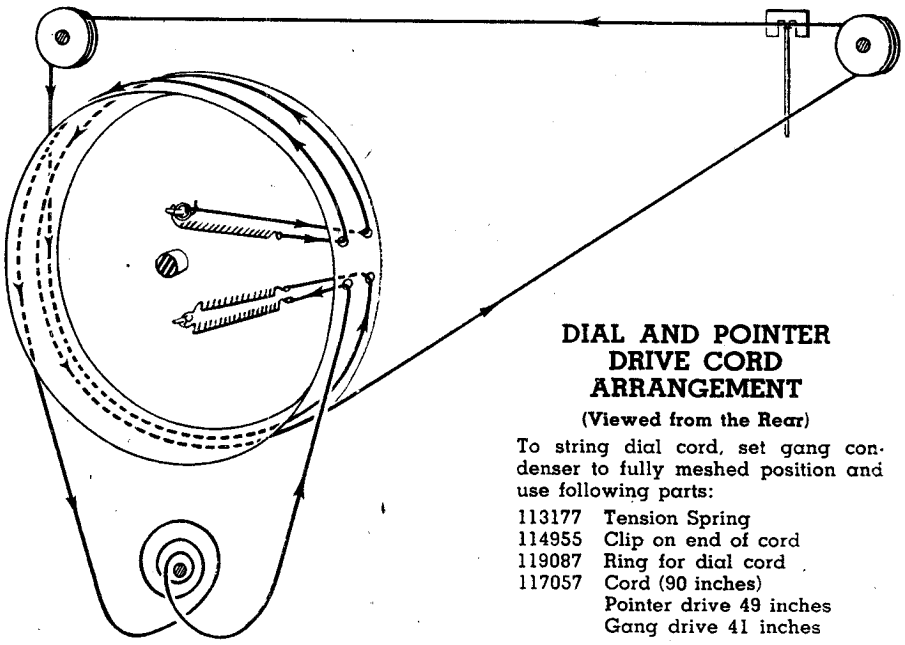
Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

(Viewed from the Rear)

To string dial cord, set gang condenser to fully meshed position and use following parts:

113177	Tension Spring
114955	Clip on end of cord
119087	Ring for dial cord
117057	Cord (90 inches)
	Pointer drive 49 inches
	Gang drive 41 inches

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

ALIGNMENT PROCEDURE

1. When gang condenser is fully meshed, dial pointer should be in the position indicated by the 54 mark on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.

2. Connect an output meter across speaker voice coil or from the plate of the 1A5GT tube to chassis through a 0.1 Mfd. condenser.

3. Connect the ground lead of the signal generator to the receiver ground lead (black) or to the chassis.

4. Set volume control to maximum volume position and use a weak signal from the signal generator.

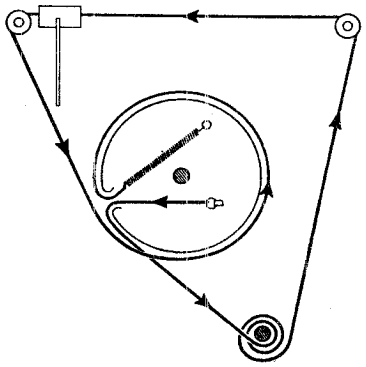
DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

114955 Clip on end of cord
117057 Cord (36 inches)
119087 Ring for dial cord
114968 Tension Spring



POWER LINE OPERATION

The following power pack may be used to operate this set on 110 volt 50-60 cycle A.C. power lines.

Porta-Power Model "H"

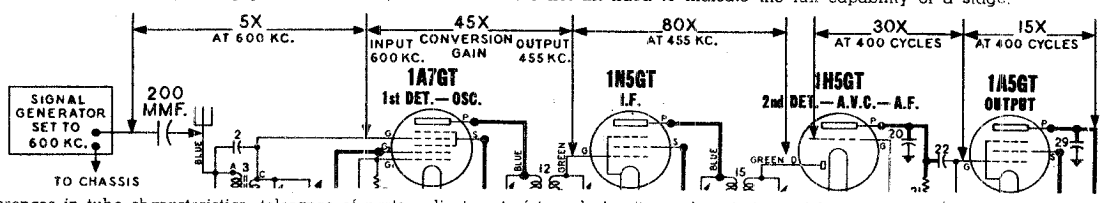
This unit is manufactured by the General Transformer Corp., 1250 W. Van Buren St., Chicago, Ill.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions.

1. For all gain measurements connect signal generator as shown. Use 600 KC signal with 400 cycles modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 1½-volt battery to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 1½ volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

ALIGNMENT PROCEDURE

1. Slide chassis partially out of cabinet by removing staples at each side of wood shelf and pulling entire shelf back about 2 inches. Do not disturb connections to loop antenna.
2. Connect an output meter across the voice coil of the speaker or between the plate of the 3Q5GT output tube and chassis through a .1 mfd. condenser.
3. Connect the ground lead of the signal generator to chassis through a .25 mfd. condenser.
4. Set the volume control in the maximum position and use a weak signal from the generator.
5. Set "AC-DC—BAT.—CHARGE" Switch in "AC-DC" position.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIG. GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

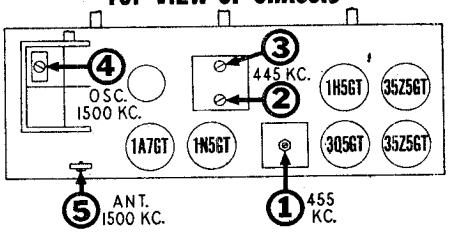
TOP VIEW OF CHASSIS



INDICATOR LAMP

The flashing neon lamp on the dial face indicates condition of batteries. This lamp is included in an oscillating (R-C) circuit which is designed to oscillate at approximately 3 pulses per second when batteries are in a fully charged condition. As the battery voltage decreases with use, number of pulses per second decreases.

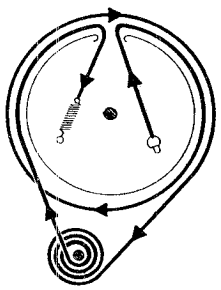
This lamp will only show the true condition of the batteries when the Selector Switch is in the "Battery" position. Lamp flashes more rapidly during charging or "AC-DC" operation.

When battery voltage is low (approximately 72 volts) the lamp flashes more slowly (about once per second). The set should not be operated from battery power after this point is reached and batteries should be recharged immediately. Charge for at least twice the time they were used and as soon as possible after they are run down. As batteries age it is necessary to charge for a longer period. For longest battery life, charge immediately after using.

IMPORTANT:
1. Completely dead batteries cannot be recharged.
2. When set is connected to a DC line, check for correct polarity by operating it before attempting to charge the batteries.
3. Batteries will be discharged if ON-OFF switch is left ON when power cord is not connected to wall outlet.

CHARGING CIRCUIT

The battery charging circuit consists of a 35Z5GT rectifier and a suitable resistor voltage dividing network. This circuit provides a very low charging current when the receiver is operated on AC-DC and is just enough to maintain the batteries but will not charge them. A separate charging position is provided for the regular charging operation. A charging rate of approximately ⅓ the discharge rate is used to give best results.



DIAL DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

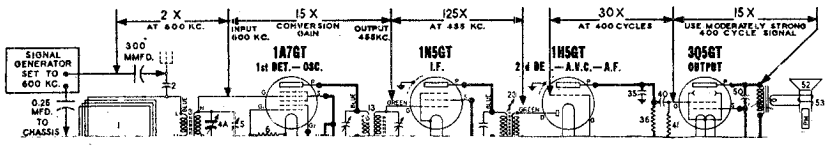
114955	Clip on end of cord
117057	Cord (28 inches)
119087	Ring for dial cord
161384	Tension Spring

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements.

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes).
2. For R.F. and I.F. measurements connect negative terminal of a 1½-volt battery to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning).
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 1½ volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

DIAL AND POINTER DRIVE CORD ARRANGEMENT

Top view
Dial plate removed

To string dial cord, set gang condenser to fully meshed position and use following parts:

114955 Clip on end of cord
117057 Cord (40 inches)
119087 Ring for dial cord
161394 Tension Spring

IMPORTANCE OF MAINTAINING FIXED POSITIONS FOR LEADS AT TOP OF CHASSIS

The shielded leads which are routed to the "Radio-Phono" switch and volume control should be tied to the upright bracket which supports the dial assembly. Grounded shields on these leads must not be allowed to contact electrolytic condenser case. If case of condenser is grounded it will short out bias voltage for 6V6GT tube.

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

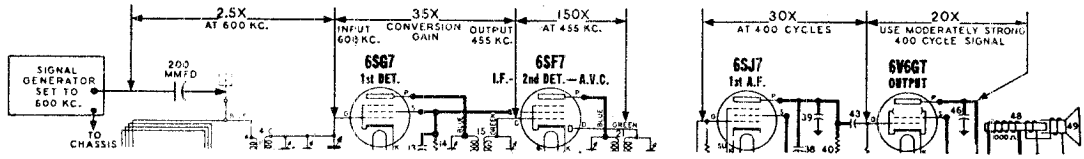
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 K.C. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "D" of antenna coil; then connect positive battery lead to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

Remove chassis and loop antenna (cabinet back) from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.

With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.

Connect an output meter across the speaker voice coil or from the plate of the 6V6GT tube to chassis through a .1 Mfd. condenser.

Connect the ground lead of signal generator to the receiver chassis.

Set volume control at maximum volume position and use a weak signal from the signal generator.

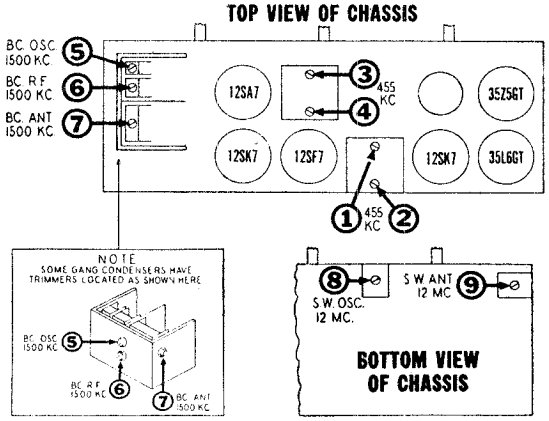
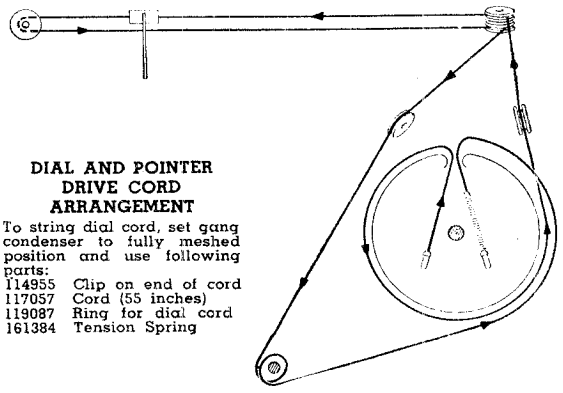
ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Broadcast	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Set pointer to 12 MC. Reference line stamped into metal dial plate (second line from the right)	8	Short Wave Oscillator	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC. with trimmer screw farther out. Recheck image.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Tune to 12 MC generator signal	9	Short Wave Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

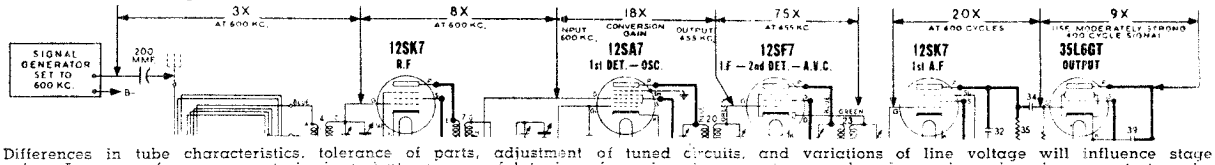
114955 Clip on end of cord
117057 Cord (55 inches)
119087 Ring for dial cord
161384 Tension Spring

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

ALIGNMENT PROCEDURE

1. With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.
2. During the alignment of this receiver it will be necessary to set the dial pointer to the following frequencies: 1500 Kc., 600 Kc., 6 Mc., 5.1 Mc., 20 Mc., and 19.1 Mc. In order to avoid replacing the chassis in the cabinet each time a dial setting is required, it will be found more convenient to mark the required frequency points on the white dial background plate before starting the alignment.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— lug through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead of signal generator to B— lug.
   CAUTION: If your test oscillator is designed with an AC-DC power supply, connect ground lead of signal generator to B— lug through a .25 mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT: Align this receiver in exactly the order shown below. Broadcast band should be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

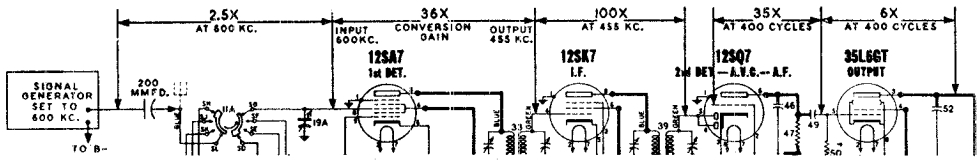
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "H" of Intermediate band antenna coil (15); then connect positive battery lead to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

SPECIFICATIONS

Voltage Rating ..... A.C. 105 to 130 Volts
Type of Circuit ..... Superheterodyne with Push Button Tuning
Tuning Ranges ..... A—540 to 1600 Kc., C—8.8 to 12 Mc.
Number and Type of Tubes—7
1—6SK7 R. F. Amplifier
1—6SA7 Modulator and Oscillator
1—6SF7 I. F. Amplifier, Demodulator and A. V. C.
1—6SC7 Audio Amplifier and Inverter
2—6V6GT Output
1—5Y3G Rectifier

Input Power Rating ..... 96-115 Watts
Intermediate Frequency ..... 455 Kilocycles
Speaker Voice Coil Impedance at 400 Cycles Approximately 3.5 Ohm
Speaker Field Coil Resistance ..... 950 Ohms
Power Output ..... 10 Watts 10% Distortion, 12 Watts Maximum

NORMAL VOLTAGE READINGS

Take all readings with chassis operating and tuned to 1000 kc.—No signal.
Use a line voltage of 117 ±5 volts or make allowance for the variations.
Voltages on location chart are taken with a 1000 ohm per voltmeter.
Voltages on table listed below are taken with an electronic voltmeter.
Read from indicated terminals to chassis base.

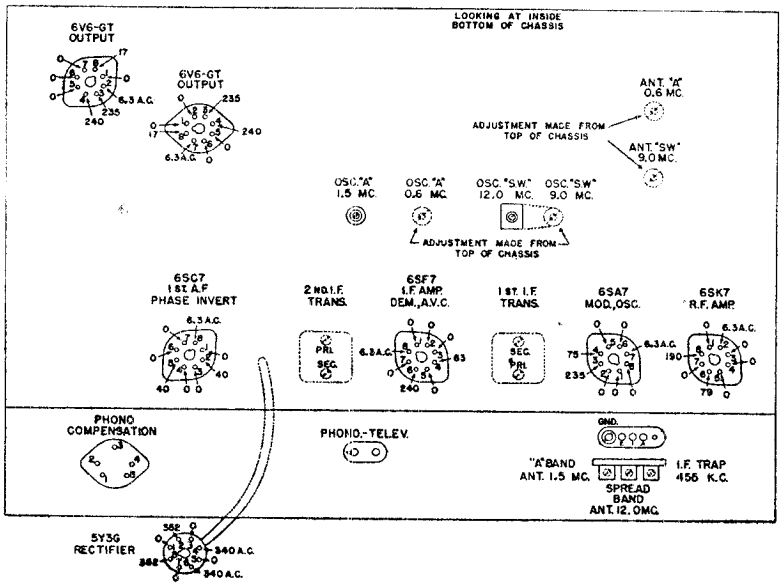
LOCATION CHART



ALIGNING INFORMATION

Never re-align unless absolutely necessary.

Use a good modulated signal generator (test oscillator with variable output voltage and a sensitive output meter across the voice coil of the speaker).

Always align using the smallest possible input from the signal generator. A strong signal makes adjustments inaccurate.

Always have the volume control "full on".

ALIGNING PROCEDURE (follow this order exactly).

I. Intermediate Frequency Adjustments.

1. Set range switch to Standard Broadcast position (loop).
2. Turn the tuning control to extreme low frequency end of dial.
3. Connect the ground terminal of the signal generator to the ground terminal of the chassis.
4. Introduce a modulated signal of 455 kilocycles to the grid of the 6SA7 Modulator and Oscillator tube (terminal No. 8) using a 0.1 microfarad capacitor in series with the output lead of the signal generator.
5. Adjust the I. F. aligners for maximum output in the following order:
   A. Secondary of second I. F. Transformer.
   B. Primary of second I. F. Transformer.
   C. Secondary of first I. F. Transformer.
   D. Primary of first I. F. Transformer.

II. Dial Pointer Adjustment.

With the plates of the gang tuning capacitor fully engaged, check to be sure that the dial pointer is in a vertical position directly on the calibration marks located at the low frequency end of the dial scale. Adjust the dial pointer if necessary.

III. Radio Frequency Adjustments.

Short Wave Range

1. Remove the output lead of the signal generator and the 0.1 microfarad capacitor from the grid of the 6SA7 tube.
2. Disconnect the output lead from the signal generator and replace with a few turns of wire connected to the signal generator output terminals.
3. Place the signal generator two or three feet from the receiver's loop.
4. Set the range switch to the short-wave range position.
5. Set the signal generator frequency and the receiver tuning dial to 9 megacycles.
6. Adjust the 9 megacycle oscillator and loop aligners (iron cores) for maximum signal.
7. Set the signal generator frequency and the receiver tuning dial to 12 megacycles.
8. Adjust the 12 megacycle oscillator aligning capacitors for maximum signal. Then rock the tuning gang capacitor slowly through resonance and adjust the 12 megacycle antennae aligning capacitor for maximum signal.
9. Repeat operations 5 and 6.
10. Repeat operations 7 and 8.

Standard Broadcast Range

1. Set the range switch to the "Loop" position.
2. Set the signal generator frequency and the receiver tuning dial to 600 kilocycles.
3. Adjust the 600 K. C. oscillator and antennae aligner (iron cores) for maximum signal.
4. Set the signal generator frequency and the receiver tuning dial to 1400 kilocycles.
5. Adjust the 1400 K. C. oscillator and antennae aligning capacitors for maximum signal.
6. Repeat operations 2 and 3.
7. Repeat operations 4 and 5.

IV. Wave Trap Adjustment.

1. Tune the receiver to 1000 kc.
2. Set the signal generator frequency to 455 kc. Increase signal generator output until audible in speaker.
3. Adjust the wave trap aligning capacitor for minimum signal.

35Y4	Rect.	105AC	117AC	0	117AC	0	25.8	105	85AC

NORMAL VOLTAGE READINGS

Use a good voltmeter having a resistance of at least 1000 ohms per volt. See chart below if electronic voltmeter is used.

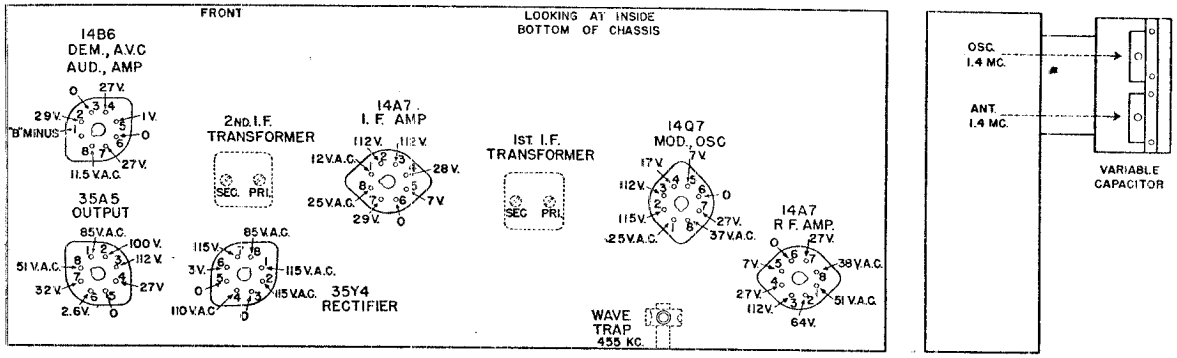
Take all readings with chassis operating and tuned to approximately 1000 Kc.—no input signal.

Use a line voltage of 117 volts or make allowance for the variation.

Read from indicated socket terminals to B minus. A convenient point is terminal No. 1 of the 14B6 Dem. A.V.C. Socket.

See Location Chart for position of terminals.

A. C. Voltages are indicated as A. C.; when the receiver is operated from a D. C. power supply, D. C. voltages will be obtained in place of A. C. voltages shown.



ALIGNING INFORMATION

Never realign unless absolutely necessary.

Use a good modulated signal generator (test oscillator) with variable output voltage and a sensitive output meter across the voice coil of the speaker.

Always align using the smallest possible input from the signal generator. A strong signal makes adjustments inaccurate.

Always have the volume control "full on".

Important: Be sure the metal plate is fastened in place on the bottom of the chassis before alignment is attempted.

ALIGNING PROCEDURE (follow this order exactly).

I. Intermediate Frequency Adjustments.

1. Turn the tuning control to the extreme low frequency position. (Variable capacitor plates all the way in.)
2. Connect the ground terminal of the signal generator to the chassis base.
3. Introduce a modulated signal of 455 kilocycles using a .01 mfd. capacitor in series with the lead from the signal generator to the antenna connection located at rear of the pickup loop.
4. Adjust the I. F. aligners for maximum output in the following order:
   - A. Secondary of second I. F. Transformer.
   - B. Primary of second I. F. Transformer.
   - C. Secondary of first I. F. Transformer.
   - D. Primary of first I. F. Transformer.

II. Dial Pointer Adjustment.

With the plates of the gang tuning capacitor fully engaged set the dial pointer in a horizontal position directly on the upper edge of the calibration mark located at 550 Kc. on the dial scale.

III. Radio Frequency Adjustments.

1. Replace the .01 mfd. capacitor in series with the output lead of the signal generator with a 200 mmf. capacitor and connect to the antenna terminal located on the back of the loop assembly.
2. Set the signal generator's frequency and the receiver's tuning dial to 1.4 megacycles.
3. Adjust the oscillator and antenna aligning capacitors for maximum signal.
4. Set both the signal generator's frequency and the receiver's tuning dial to 0.6 megacycles and check calibration.
   NOTE: If the calibration is too far off at 0.6 megacycles, operations 2 and 3 may be repeated until the best results are obtained.

Wave Trap Adjustment.

(Leave the receiver connected in the same manner as when making the Radio Frequency Adjustments.)

1. Tune set to 1000 K. C.
2. Set the signal generator frequency to 455 K. C. and introduce a fairly strong modulated signal to the receiver.
3. Adjust the wave trap aligner for minimum signal.
